I have one unit, Motorola radius P110 UHF, 2 channel, model #P44QLC202AA. with battery(7.5V) No charger/NO ANTENNA. Unit poweres up fine. Best offer takes it...

3837. Scanner eavesdropper pleads guilty vs. Tom Cruise....

Newsgroup: rec.radio.scanner
Date: 1999-03-12 00:00:00 UTC
From: Karl Dahlquist <karldahlquist@vistagroupusa.com>
Message-ID: <7ccea9$1vi$1@ash.prod.itd.earthlink.net>
Source record: 125143

LOS ANGELES, Posted 3:57 p.m. March 12, 1999 -- The man who eavesdropped on a cellular phone call between Tom Cruise and wife Nicole Kidman, then sold the information to a tabloid, pleaded guilty to federal wiretapping charges.

Eric Ford, 27, of Sherman Oaks, entered the plea yesterday after signing an agreement with federal prosecutors, reports The Associated Press. In exchange, the U.S. Attorney's Office dropped two related charges against him.

According to news reports, the tabloid photographer will likely get between six months and a year behind bars when he is sentenced May 17. He also will be fined between $2,000 and $20,000.

"I'd like to apologize to Tom and Nicole," Ford told reporters outside the courtroom. "I'm sorry."

According to AP, Ford was indicted in December on three federal wiretapping charges.

Ford allegedly used a modified radio frequency scanner to eavesdrop on a Feb. 5, 1998 phone call Kidman made to her husband after leaving the set of "Practical Magic."

A wire service reports the photographer allegedly shopped the tape to several tabloids and entertainment TV shows, including a London tabloid, News of the World, before selling the information to The Globe on June 12, 1998.

An article based on a recording of the conversation ran in a June 30 issue. According to The Globe, a woman believed to be Kidman tells the man their nearly 8-year marriage is "hanging by a thread."

The Globe denies any wrongdoing and was not charged.

Through their publicist, Cruise and Kidman declined to comment on the case.

Try TalkPCR at 'www.mahy.demon.co.uk'

It is Delphi 3, no DLLs or helpers only direct calls to windows API, no additions to your windows/system.....ini files. TalkPCR will not alter your system, the TalkPCR .ini is kept in its own directory. Why use the registry or put the ini files in the windows directory on a very type specific program?

Pete Mahy, G4NIS.

Let me know what you think, 'DJN@mahy.demon.co.uk'

Hello Netfriends,

I'm trying to identify the chip used in the Uniden BC-3000XLT as the
RF receive frequency synthesizer. According to my schematic, it's
labeled "M640866P", but I can't seem to find any info about it.
Does anyone have complete info about this chip or at least a
manufacturer name? A data sheet would be probably too much to ask
for...:-)
In addition, I'd like to get a full partlist of this scanner.

Thanks and best regards,
T-man

Note: when Replying, please email me directly in addition
to posting here, so I don't miss any responses. Don't forget to
remove the "97" from my email address inserted as an anti-spam
counter measure...:-)

Frequency inversion scrambling defeat method.
Just a note that if you have a scanner/receiver that does sideband:
You've heard the cordless phones that scramble with freq inversion or the police dept freqs that do the same ?
If so and you have a scanner that does sideband (ie. IC-R10) you can, while on the freq where the conversation is taking place, set the radio in AM upper SSB mode and increment at .1KHz steps until you hear the voices come in loud and clear.

I was about to say.... don't go by the s meter alone.... the 9000 has a very loose s meter, while the 8200 is not sensative at all....

Having all three radios, I find the answer to be just that..... have all three radios...

Depending on the band you're listening to, I would have to say the R2 is third on HF.

So many toys..... so little time.

>AOR-8000B

The R-10 only scans at 16 channels per second. Also, with the ICOM, you can scan one bank , or all the banks at once. You cannot scan, say, banks 1,2 & 5, while skipping the rest. It's one, or all of them.

I found a scanner in my basement and I decided to try it out.

It is a Realistic Pro 2020. I have figured out how to program channels in and I have listened to a few things.

I have rabbit ear attennas hooked up to it right now and it seems to be working alright but I was wondering if there is a better thing I can do to get more people on it?

Also if someone has a manual or something about the pro 2020 can you please forward it to me, because there are some buttons on here I still don't understand.

And I also have a Pro-7B Model 20-173. If someone can help me with this thing because I have no idea how to use it.

Thanks a lot!!!

Last night I downloaded the RealProducer from real.com thinking it would be cool to put streaming audio clips on my website at www.houstonscan.com. After I downloaded it I hooked up my scanner to a tape recorder and went fishing something exciting. Here in Houston that doesn't take long. I recorded a 4 minute chase and was able to get it into the newest Real Audio format and on my website in minutes. I'd love for you to listen to it and let me know what you think. My website host recently informed me that I would soon have unlimited webspace (in exchange for one of those yucky GeoCities like banner) so I expect to have more clips in the future.

BTW: This chase has a guy bailing out of a car and the car crashing into and 18-wheeler.

whats the best hand held scanner for around 350 dollars, in your
opinion? i like general coverage of all bands, dont really care about
cellular. but need a good reciever.
im considering the:
AOR 8000
DJ-X10 ALINCO
MVT-9000 YAPATERO (or whatever that stupid thing is called)
or anything else thats out there, im no expert.
any feedback is appreciated.
thanks for your time and help,
shannon

On Sun, 7 Mar 1999, Jimmy Conway wrote:

> Should be FRS Family radio service.No license required . operate on
> 467MHz

FRS uses the 7 GMRS interstitial frequencies, plus the 7 interstitial
frequencies on the repeater input side of GMRS (which are not used by
GMRS). They are:

The seven GMRS Interstitials:
462.5625 462.5875 462.6125 462.6375
462.6625 462.6875 462.7125

The repeater side GMRS interstitials:
467.5625 467.5875 467.6125 467.6375
467.6625 467.6875 467.7125

The first seven are GMRS frequencies, the later seven are between GMRS
frequencies, but not actually used by GMRS.

I suspect that in some cases, it's a matter of principle-most radio people know that the regs are totally dumb, and don't want to buy a "nutered" radio, even if they don't make a habit of CMT monitoring.
Anyway, in the case of ham operators, they should be exempted anyway-the second harmonic of a popular ham band just happens to be right in the center of the CMT base band-so checking the second and third harmonics of their signal using a receiver(which hams have always used as a way of testing equipment) becomes impossible.

Hi,

I've just uploaded a beta version of ARC8200 for Windows with memory
manager. (Advanced Radio Control for the AR8200).

The memory manager supports uploading data to bank e for beta testing.

You can download the latest beta from my website at http://arc.mypage.org
and then the AR8200 software section.

Any suggestions/remarks are welcome.

Regards,

Gommert

3883. A Brief History Lesson

Newsgroup: rec.radio.scanner
Date: 1999-03-12 00:00:00 UTC
From: heradiodotus@dead.greek-historians.org
Message-ID: <36e9418c.1738029@news>
Source record: 125222
Cross-posted to: rec.radio.scanner,alt.radio.scanner

These are the researches of Her(adi)odotus of Halicarnassus, which he publishes, in the hope of thereby preserving from decay the remembrance of what men have done, and of preventing the great and wonderful actions of the PCR1000 Pioneers from losing their due meed of glory.

2/11/98: One of the first hardware frequency modifications for the PCR1000 is posted to qrz.com. By repairing a cut trace and (de)soldering some jumpers, a PCR1000 could tune the ECPA-forbidden cellular telephone bands. The developers of this mod debated whether to make it available by request only, or to publish it. Because others were selling similar mods for exhorbitant sums, the decision was made to publish.

7/24/98: The much sought-after EX-2099 calibration software is discovered on a "utiles" page on an Argentinian web site. A horde of hungry reverse engineers decend upon it with verve.

7/27/98: Initial release of Patrick Masotta's PCR1000BUR utility, allowing PCR1000 owners to back up their EEPROM settings. Another facility of this program allowed owners to change the version settings of their radios; by changing a radio from the "FCC USA" version to the "EUR/AUS" version, the cellular frequency ranges because unblocked - no hardware modifications necessary. PCR1000 owners revel in unblocked listening pleasure.

7/28/98: Amidst the general euphoria, John McDermon suggests that PCR1000 list members "keep the chatter down a little bit" lest the FCC find out about the ease with which the PCR1000 can be unblocked. Greg Remer replies that the information has already hit the Strong Signals web page, and that "USENET cannot be far off." Steven Peck also expresses concern that ICOM will catch wind of the EX-2099 web site and force the webmaster to remove the files.

7/30/98: Links to EX-2099 and all other ICOM utility software are removed from the "utiles" web page. The actual files remain accessible via direct URL for a short time, but eventually they too are deleted.

8/7/98: The News Flash page on the Strong Signals web site reports that ICOM has received a "memo" from the FCC stating that modifiable receivers will no longer receive certification. Netizens speculate that ICOM will pull the PCR1000 from the US market rather than spend the money to make it unmodifiable.

2/99: New purchasers of PCR1000's discover that NEITHER THE SOFTWARE NOR THE HARDWARE modifications will restore cellular reception to their radios. Unless a new modification is developed, the days of the easily unblocked PCR1000 appear to have ended.

A scant 11 days elapsed between the first public revelation that a simple EEPROM change could unblock cellular reception and the report of the "memo" from the FCC. Never underestimate the speed at which the wheels of government can turn when properly motivated...

He's absolutely right. What most people don't realize is that amplification increases the noise and unwanted signals too. Unless your are distant from your desired station, it is probably best to not use one.

That's $.04 worth now.

Guilty plea in Tom Cruise case

LOS ANGELES, March 12 (UPI) - A paparazzo who was accused of illegally intercepting a cellular phone call between actor Tom Cruise and his wife, actress Nicole Kidman, and selling information about the conversation to two tabloids has pleaded guilty (Friday) in a Los Angeles courtroom. Eric Ford was arrested last year on suspicion of using a scanner that had been modified to intercept a call between Cruise and Kidman in February. He faces up to five years in federal prison.

Its sounds, (from seeing the reviews), like a nice scanner. With an R2 as your first scanner you won't have the discrimination factor to compare with a scanner with an actual keypad, (for entry, etc), if you never used one. I would like the keypad as I have always used scanners with them, but you're starting out without one (if you buy the R2) so that is a plus.
Colorado Springs is not big into the trunking system yet as all the Police, fire and sheriffs are on the VHF/Hi and UHF band so no need for a trunker (yet). Denver is into trunking and the Springs is looking into a system but that is in the out years. The cell industry in Colo Springs is still analog so an unblocked R2 would hear those (if desired).
The Colo Springs area is also good for SW and AM stations heard from both USA coasts in the evening hours I assume because of the states location and open areas so the R2 would be good for that too.
Their are military installations close by so the milair freqs (225-380 MHz) the R2 can get would be a plus.
So I guess what I am saying (opinion only) it would make a good first scanner given the above.

From: nexus@ametro.net
Message-ID: <7ce8e5$r9g$1@osh1.datasync.com>
Source record: 125087

Charlie Brookhart (cbrookha@erols.com) hath said:
: What are the frequency ranges for the Motorola Radius GP300? I went to the
: motorola site and found that this radio is not listed, but the newer model
: (GP350) is listed. Is this because the GP300 is an old model and is no
: longer being made? Also, what are the frequency ranges for the MT2000
: radio?
: Charlie

Impossible to answer correctly. GP300's can come in several
different bands, vhf, both hi and low, and all of uhf. Look at
the antenna, if its either real short or real slim then its
going to be UHF, if the antenna is about 6 inches and big, the
same size top-to-bottom its most likely vhf.

From: cloaked@nowhere.gov
Message-ID: <36eaa988.4041877@news>
Source record: 125092

Is it just me, or is the scanner control software that comes with the Sony ICF-SC1PC a little whacked? Some of the tabbed dialogs are blank, e.g. Operations->Tune->Direct shows a BLANK direct tuning dialog; if I click the Preset tab, the preset tuning dialog is fully populated. If I select Operations->Tune->Preset, the PRESET dialog is now blank, and clicking on the Direct tab shows a fully populated direct tuning dialog. I've noticed other oddities, as well, like certain menu items being grayed out when they shouldn't be, preventing me from doing things like entering preset memory channels.

I've also noticed that the Spectrum frequency database included with the scanner crashes 99% of the time (it has only worked correctly once). I can ignore the error and continue, but the crash is still somewhat annoying. Good thing the database itself is a .DBF file and can be read by just about anything... ;-)

It's a nice scanner, but the software seems to need some work.

Scott Coleman, President ASRE (American Society of Reverse Engineers)

Message-ID: <4700-36EAD1EF-31@newsd-123.bryant.webtv.net>
Source record: 125101

The power supply is bad! The power supply is suppose to convert the 117 v. alternating current into 6 or 9 or 12 v. (depending on the scanner) direct current. There is a transformer that first drops the voltage, and then one or more diodes that form a rectifier circut. which changes the ac to dc. Following this there are one or more capacitors that filter the dc. More than likely, this capacitor has gone bad or is not connected.

Go to Radio Shack and see if you can't find another power supply that will match.

If you check the links that are on both of those sites you will find more then
you want.

that is all a hoax.. if people would read the newspaper they are not going to do that(make you pay extra)..also alot of areas are still waiting to even get Cable modems.. It seems there still in the testing stage.

3930. Re: CHP - Position 3

Newsgroup: rec.radio.scanner
Date: 1999-03-13 00:00:00 UTC
From: mikek@deltanet.com
Message-ID: <36eb2612.419151691@news.concentric.net>
Source record: 125119

The CHP uses VHF portables - here is the channel loading:
Ch. 1 154.905 173.8Hz. Repeats onto the station frequency
Ch. 2 154.905 156.7 Repeats onto the car frequency
Ch. 3 154.905 n/a portable-to-portable simplex
Ch. 4 154.920 n/a CLEMARS (Ca. Mutual Aid)
Ch. 5 156.075 n/a CALCORD On scene coordination
Ch. 6 155.475 n/a NALEMARES National mutual aid
Ch. 7 154.935 192.8 Motorcycle repeaters.

Hope that helps.
Mike

As I sit and read all of the replies to the question "why listen" I think to myself that at any given moment cellular radio transmissions are entering my home, uninvited, are passing through my body, uninvited, and therefore I have ownership of the data contained therein. You want it private, keep it out of my house and my body!

Source record: 125121

Anyone else out there have/use/seen the "Datametrics Communications Manager" for the Radio Shack Realistic PRO-2006 Scanning Receiver?

I have the hardware and manual, but have lost my software diskette! Found a 6 year old mailing address for the company, wrote them, no answer. My original invoice lists no phone number! Must assume they are out of business :-(

Anybody have a software diskette they would like to share?

Source record: 125122

I think you might be doing this the hard way. You could probably
just go to the courthouse and look up the latest burglaries.

Another approach would be to call the LA Times business editor
and ask if he'd be interested in a story about your company
that is offering free alarms to burglary victims. If they run the story
you'll get more leads than you could ever handle (just be sure to
ask the victims for a copy of the police report to verify it).

If you are uncomfortable approaching the LA Times, call a
local PR agency that has contacts with the Times and they'll
pitch the story for you.

I have the Radio Shack PRO 90 trunk tracker and im very satisfied with it. at
less than three hundred dollars i feel it is the best all round protable
scanner i would suggest a trip to the nearest Radio Shack and check out the
scanner section.

Actually, what fuel inane legislation like the ECPA is highly paid
lobbyists representing the cellular telephone industry. You see, it's
cheaper to spend a few hundred thousand on lobbyists than the many
millions it would take to retrofit their analog cellular systems to
enhance privacy and prevent fraud.

==========
Bill Cheek's Scanner Data Decoding
Frequently Asked Questions File
==========

Contents
=========

01: What is a 'Discriminator Output' and 'baseband audio'?
02: How can I find the Discriminator Output in my scanner?
03: How do I connect to the Discriminator Output?
04: How do I build or acquire a SIMPLE decoder interface?
05: How do I build or acquire a BETTER decoder interface?
06: So how do I decode digital data from the airwaves?
07: How can I decode CTCSS, DPL, and DTMF from the airwaves?
08: Is it possible to "TrunkTrack" without a TrunkTracker?
09: What if I don't want to build my own Data Decoder Interface?

Questions and Answers

==========
01: What is a 'Discriminator Output' and 'baseband audio'?

There is a growing interest in tapping the baseband audio out of various scanners for decoding of a variety of esoteric signals, including CTCSS, SCA, FSK, RTTY, FAX, Pager data, and trunked system control data, etc.

By and large, such signals cannot be taken from TAPE REC jacks, headphone jacks, and EXT SPEAKER jacks because of the voice-band filters that are between the signal source and these output jacks.

Therefore, it is necessary to tap the wider "baseband audio" directly at the output of the NFM discriminator chip in your scanner. This is the first step to successful data decoding from the airwaves.

==========
02: How can I find the Discriminator Output in my scanner?

Table 1 shows a list of scanners, the discriminator chip(s) used in the scanner, circuit symbols of those chips, and the baseband audio (discriminator output) pin.

If your scanner isn't listed in Table 1, then refer to Table 2 to find its discriminator chip. The chips listed in Table 2 are all known Discriminators used in scanners and wide coverage receivers.

Between Tables 1 and 2, you should be able to find the NFM discriminator and its output pin for any reasonably modern scanner.

Corrections and additions to these lists are requested. See my email and other addresses at the end of this file.

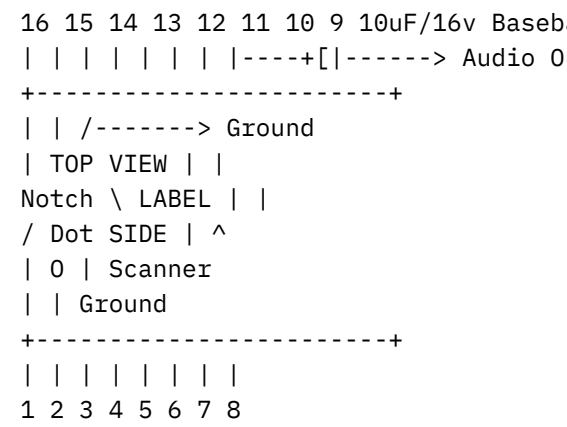
Once you locate the discriminator in your scanner, you have to make its output conveniently available on the exterior chassis, much like a headphone or tape recorder jack.

Figure 1 below shows how to determine the pin numbering system for most integrated circuits. Looking at the marking side of the chip, there is either a notch or nook at one end, and/or an embedded "dot" off to one side at one end.

The notch, nook, or dot signifies the end that starts with
Pin #1 and ends with whatever the highest numbered pin
happens to be. Most IC's have 8, 14, 16, or 18 pins.

FIGURE 1
TYPICAL NFM IC CHIP PINOUT



NOTE: Figure 1 shows the baseband audio tap on Pin 9,
though the pin number will vary from one chip
to the next.

==========
03: How do I connect to the Discriminator Output?

HOOKUP PROCEDURE
==========

If you need the raw NFM Discriminator baseband audio signal
for external purposes, the best way to access it is via a
jack installed in a convenient, unobtrusive location on the
scanner. Use Figure 1 as a general guide.

1A BASE SCANNERS: Install an RCA or other jack in a desired
place on the scanner's external case, typically the rear
panel.

1B HANDHELD SCANNERS: If you can find the space, use a
standard monaural 1/8" phone jack or a 3/32" mini phone
jack. Some scanners are so cramped inside that even
these won't fit. In that case a strip of 3 pinline
sockets can be melted into the plastic case and wires
soldered to the inside protrusions.

The middle pinline socket is not connected to anything;
it's just there as strength and support for the pinline
plug you make, with the shield ground soldered to one
end and the audio- center soldered to the other end:

GND---o o o---NFM DSCR (audio)

"Break-apart" pinline plugs/sockets are available from
Mouser, DigiKey, and Hosfelt.

Digi-Key: p/n A208-ND (800) 344-4539
Hosfelt: p/n 21-274 (800) 524-6464
Mouser: p/n 151-5520/5530 (800) 346-6873

These little puppies are good for a lot of hacker needs,
so get a supply!

2. Connect the shell or outer frame part of the jack to
scanner chassis ground. (Use one end socket for pinline
connections)

3. Connect the (+) leg of a 10-uF tantalum capacitor (Radio
Shack #272-1436) to the Discriminator output Pin. (Capacitor
should be tantalum, but can vary in value from 2.2-uF to
10-uF at a voltage rating of 16-35 vdc.)

4. Connect the center conductor of a shielded coax (RG-174,
etc) or shielded mic cable to the (-) leg of the
capacitor. NOTE: if the distance from the NFM tap to the
jack is less than 3", then a single unshielded hookup
wire will do fine.

5. Connect the shield of the cable at this end to a nearby
PCB ground trace or spot.

6. Connect the center conductor of the other end of this
cable (or single hookup wire) to the center or hot lug
of the jack.

7. Connect the shield of the cable at that end to the
ground lug of the jack.

8. Fabricate or buy a shielded patch cable with one end to
mate with the new jack on the rear of the scanner at
that end....and the other end to mate with whatever jack
is on the tape recorder, processor, decoder, or whatever
device is to be connected at the other end.

Now you are ready to connect a data decoder interface to the
baseband audio output jack. See Figure 1 above.

==========
04: How do I build or acquire a simple decoder interface circuit?

If you want to decode trunk control, MDT, some pager, fax and/or
other digital signals, you will need to build or buy a simple
2-Level FSK Interface to go between the NFM Discriminator/
Baseband Audio of the scanner and a standard PC serial port.

See Question #5 for a more sophisticated 4-Level FSK Interface.

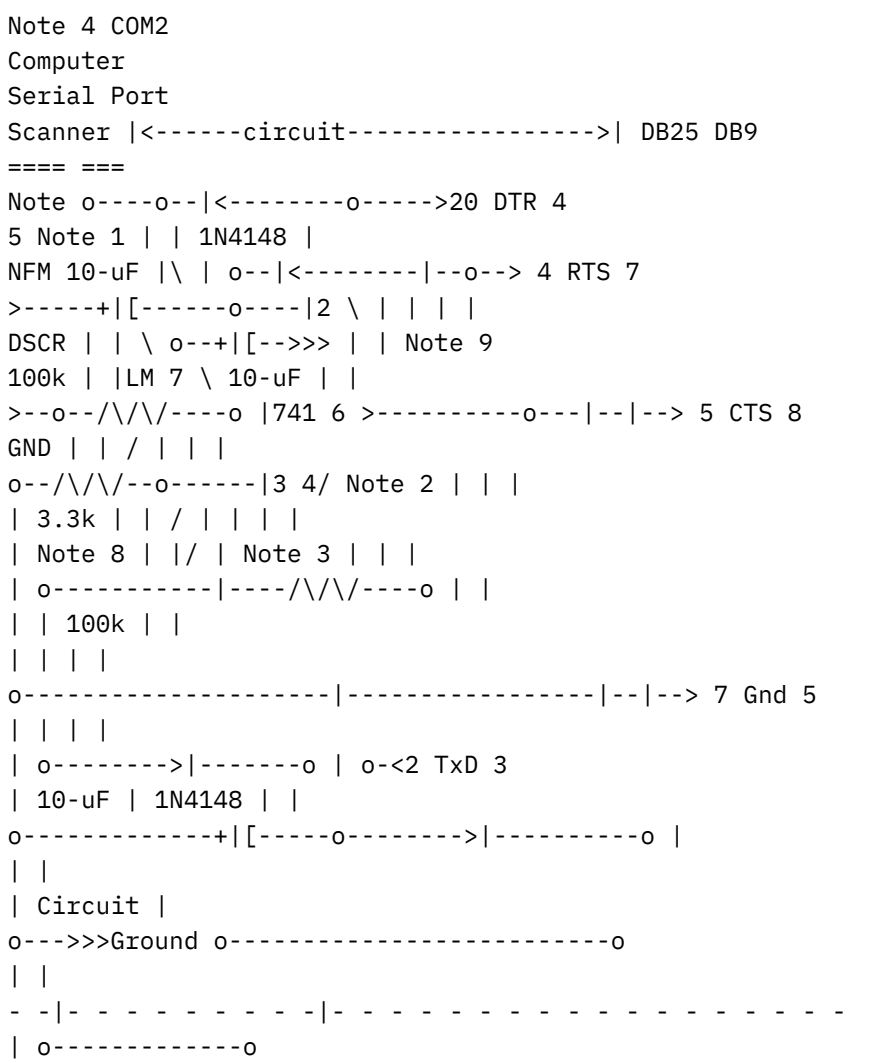
If you are not capable of building your own, or if you
don't have the time to mess with it, I can supply either

a Kit of all essential parts and detailed instructions,
and you build it yourself, OR I can supply an assembled/
tested Decoder Interface, built inside a DB-25 shell and
connector with a 3 ft shielded cable terminated with an
RCA plug. See Question #9 for details.

The DB-25 shell connects directly to a DB-25 comport on the
PC, or, if your comports are DB-9's, you can get a
DB25-to-DB9 adapter for it. You should, however, be able to
make your own following the below instructions.

This is a tried and true Data Interface circuit that's good
for everything we've tried, including a wide variety of
scanners. External power is not required. This circuit
draws its power from the comport. It is similar to the
"Hamcom" and "data slicer" interfaces, but is optimized for
more scanners and more applications.

2-LEVEL DATA DECODER INTERFACE SCHEMATIC DIAGRAM
Copyright (c) 1998 Bill Cheek <Revised 12/04/98>



```
| |
| | Optional for TrunkFollower
| | Control of a second scanner
^ ^ (See Note 10 and Q&A #8)
Gnd RxD
COM3
or other
port for Trunk
Follower control
```

LEGEND:

```
|
--o-- = soldered connection/junction
```

```
--o = turn of the trace in the drawing
|
```

```
--|-- = crossover (no connection)
+|[ = capacitor, polarized (note the +)
>| = diode (anode->|-cathode)
|< = diode (cathode-|<-anode)
-/\/\/- = resistor
-->>> = ground
```

NOTES:
1. Use tantalum capacitors, +|[polarity as shown

2. Radio Shack's LM-741 op-amp works fine. Others might not!

3. Use 1/4 or 1/8 watt resistors to conserve space

4. Build circuit on a trimmed and fitted piece of perf board inside a DB-25 shell for max efficiency and space savings. DB-25 connects to PC's comport and a shielded cable from the scanner goes to the input; shield is ground and center is audio.

Hi-res laser printed Instruction Sets available with precise schematics, drawings, perfboard layout, graphics, wiring, and solder points. Inquire: bcheek@cts.com or see:

http://ourworld.compuserve.com/homepages/bcheek/decode.htm

5. Many handheld scanners have no space to install a phone jack for the NFM Discriminator Output. For such tight spaces a strip of 3 pinline sockets can be melted into the plastic case and wires soldered to the inside protrusions. The middle pinline socket is not connected to anything; it's just there as strength and support for the pinline plug you make, with the shield ground soldered to one end and the audio-center soldered to the other end:

GND---o o o---NFM DSCR (audio)

6. For base scanners, install a female RCA jack on rear panel.

7. For handheld scanners where there is space, use a 3/32" mini or a 1/8" standard monaural phone plug.

8. 3.3k is an optimized value for most scanners. If the baseband audio output measures less than 0.350-V AC, with a voltmeter set to AC-volts at a 1v range, you should decrease the 3.3k resistor to 2.2k, or even 1k if if the measurement is under 0.250v AC.

I measured 0.150v AC out of the baseband audio tap in a Sony ICF-SC1PC handheld scanner. The required resistor from U1 Pin 3 to ground worked out to 1k.

The NFM baseband audio signal of most scanners should show 0.400v AC or higher, in which case the 3.3k resistor is just right.

9. Connect the interface to a comport on the PC. Plug the input cable in to the scanner's NFM Discriminator Output Jack. Tune to a desired signal and run the decoder software of your choice.

10. If you are interested in using the "data decode" scanner to control or "TrunkFollow" a second scanner, then run a pair of wires off the Data Decoder Interface from unused TxD (Pin 2) and Ground (Pin 7) out the back of the circuit. This pair of wires will feed the RxD and Ground pins of another COMport on the PC.

==========

05: How do I build or acquire a BETTER decoder interface?

First, understand that you may not need or want a "better" decoder interface. The 2-Level Data Decoder Interface given just above is ample for most everything except "FLEX" and ReFLEX" pager signals. There may be other exceptions, but they are few and far between. In most cases, the simpler 2-Level FSK Data Decoder Interface will be all you need.

Secondly, understand that the more sophisticated 4-Level FSK Data Decoder Interface cannot and does not replace the simpler 2-Level version. If you want the 4-Level interface, that's fine, but you'll need the 2-Level, too.

If you are not capable of building your own, or if you don't have the time to mess with it, I can supply either a Kit of all essential parts and detailed instructions, and you build it yourself,

OR

I can supply an assembled/ tested 4-Level Data Decoder Interface, built inside a project box with a DB-9 output jack on one end and an RCA jack on the other end. You will need to provide your own shielded cable terminated with an RCA plug on one end to mate to the box and whatever connector on the other end to connect to the NFM Discriminator Baseband Audio Output on your scanner.

You will also need to provide a shielded straight-thru 9-cond serial cable with a male DB9 plug on one end to mate to the 4LFSKDDI box and whatever connector on the other end to mate to the chosen PC serial port.

You may also have to provide your own +/- dual polarity power supply. (Two 9v batteries can suffice.) See Question #9 for more details.

I'm not sure yet how to present the 4-Level FSK Data Decoder Interface circuit as a plain ASCII schematic like shown above for the simpler 2LFSKDDI circuit. So for now, I have to refer you to the Web Sites that support this circuit with graphics, text, and/or software support. You should research these sites:

http://www.geocities.com/SiliconValley/Horizon/6063/
http://www.qsl.net/pa3eik/4lev_fsk.htm
http://www.geocities.com/CapeCanaveral/Launchpad/4039/
http://www.geocities.com/CapeCanaveral/Launchpad/4039/PINFO.HTM
http://www.geocities.com/CapeCanaveral/Launchpad/4039/IINFO.HTM
http://www.geocities.com/CapeCanaveral/Launchpad/4039/POCFLEX.ZIP
http://www.geocities.com/ResearchTriangle/Lab/9339/
http://www.geocities.com/SiliconValley/Network/8916/4levelm.gif

I now have available a detailed Instruction Set on the 4LFSKDDI for those who find the above sites a little too technical to handle. I can also provide Kits of essential parts, less enclosure and power supply. See Q&A #9.

==========
06: So how do I decode digital data from the airwaves?

First, you tap the Discriminator Output in your scanner. Then build the desired Data Decoder Interface and connect it to the Discriminator Output. Then connect the other side of the Decoder Interface to a com/serial port on your PC. Lastly, run the software that decodes the particular type of signal that you want to decode.

In general, it takes different software for different kinds of signals, and I can't possibly cover them all here. I will suggest that you start out with a free program called TRUNKER that decodes the control data of Motorola trunking systems. This is one of the easiest to set up and get working; therefore, it makes a good test "platform" to prove up all your work before you

venture into bigger and better things. Motorola trunk systems are fairly common now.

TRUNKER and a good set of documentation and limited support for it can be found at the following Web Sites:

http://www.geocities.com/CapeCanaveral/Lab/1060/beta.htm

or

http://web2.airmail.net/lblant1/dfw/digital.htm

Apparently it is possible to decode certain kinds of data from the airwaves without a decoder interface - just software! For info on decoding MDT signals with nothing more than a Windows PC and a sound card, check out:

http://www.geocities.com/ResearchTriangle/Facility/7646/

==========

07: How can I decode CTCSS, DPL, and DTMF from the airwaves?

That is strictly up to specialized hardware and/or software that kind of goes beyond the scope of this FAQ. Lots of software is out and about that will do it, and there are even possibilities for "roll your own" hardware decoders.

But the first thing you'll need is the "baseband audio" output that is described in Questions/Answers #1-3 above. The Data Decoder Interface described in Q/A #4 is good ONLY for trunking and pager types of data; not CTCSS, DPL, and DTMF, unfortunately.

In fact, it takes specialized hardware and/or software to decode each of CTCSS, DPL, and DTMF; and each is as different as night and day.

Some scanners come equipped for CTCSS decoding, but most do not. And none come equipped for DPL or DTMF that I know of.

For more information about retrofitting CTCSS and DPL decoders to your scanner, contact:

Communications Specialists, Inc.
426 West Taft Avenue
Orange, CA 92865-4296
(800) 854-0547 Fax (800) 850-0547
(714) 998-3021 Fax (714) 974-3420
WEB: http://www.com-spec.com/

For a low-cost "roll-your-own" DTMF Decoder (hardware) there is a nice project done up in great detail in one of the back issues of the monthly WORLD SCANNER REPORT

newsletter, V3N10. Backissues are always available at a nominal cost. See:

ftp://ftp.cts.com/pub/bcheek/products/prodinfo.zip

There are other hardware and software solutions for decoding DTMF that I may include here later as I get the information verified and added.

The WiNRADiO Digital Suite is awesomely capable of decoding CTCSS and DTMF. See: http://www.winradio.com

For scanners in general, though, it all starts with a tap to the "baseband audio" point, so read over Q&A 1-3 above for the details.

==========
08: Is it possible to "TrunkTrack" without a TrunkTracker?

It didn't used to be, but times change and YES! It is now possible to track the trunks without a 'real' TrunkTracker Scanner, and better, for that matter!!!

Like the other subjects in this FAQ, it all begins with a Data Decoder Interface. See Q&A #4 and Note 10 in that answer for the tiny extra addition you need to make to the Decoder Interface.

Next, you need a PRO-2004, PRO-2005, or PRO-2006 scanner, although we hope to add other scanners to the list in due time. For now, it's one of those three.

NOTE: It is possible to track the trunks with a AR-8000 and perhaps with one of the Opto Interfaces, but these are specialized situations where detailed info must be found elsewhere.

Then you need a CE-232 Scanner/Computer Interface (or its predecessor, the HB-232). You will also need the hot, new Windows program for the CE/HB-232 called Pro-Turbo.

Lastly, you need one fairly modern computer, Pentium 133 or better, for the easiest way to track the trunks, but there is another way almost as easy, if you have two computers, one a 486DX2/66 or better and the other, a PC-386 or better.

There are other requirements, too, but the above are the main ones. It is beyond the scope of this FAQ to spell out all the details, but the V8N9 issue of the monthly World Scanner Report tells it all. You can order this or any other back issue of the World Scanner Report since Jan-91, including 6-mo and 1-yr subscriptions.

You can also download a more detailed text file on
TrunkFollowing with the PRO-2004/5/6 from my FTP site at:

ftp://ftp.cts.com/pub/bcheek/ce-232/trnkscan.txt

For more information on the Pro-Turbo software for the
HB/CE-232, contact:

Paul E. Turton
RR # 3; Wainfleet, Ontario Canada L0S 1V0
E-mail: pturton@iaw.on.ca or jabba@iaw.on.ca
Web: http://www.iaw.on.ca/~jabba/pro-turbo.htm

For more information on the CE-232 Interface, you can
download a file called PRODINFO.ZIP from:

ftp://ftp.cts.com/pub/bcheek/products

or you can view and download all the individual files
from the \CE-232 directory. Or, you can ask for it as
an e-mail file attachment from: bcheek@cts.com

or see the information in my signature box below.

But yes, it is now possible to track the trunks without
a TrunkTracker scanner, and do it better than any of the
"real" TrunkTracker scanners! The cost can be a lot
less than the cost of a real TrunkTracker, too. The cost
largely depends on what you already have, or can
scrounge up, but at worst, it's well within the budget
of many scannists.

==========
09: What if I don't want to build my own Data Decoder Interface?

See further below if you are intested in a 4-Level Data
Decoder Interface. First is info on the 2LFSKDDI:

2LFSKDDI
========

There isn't much of a technical obstacle to "rolling your
own 2-Level Data Decoder Interface, but if lack of time,
tools, or access to the parts is an obstacle, then you can
acquire one in either of two ways:

NOTE: We can supply the 2LFSKDDI detailed Instruction Set
alone for $5, ppd, USA and $7, ppd, foreign.

1. Kit of essential parts (you build it): $15 + $8 S&H

Includes:
3 ea Capacitor; tantalum; 10-uF/16v:
1 ea D-sub Plastic Hood/shell; DB25
1 ea DB25 connector; female; solder pin
2 ea Resistor; 100-k; 1/4-watt

1 ea Resistor; 3.3-k; 1/4-watt
4 ea Diode; silicon; 1N4148
1 ea Op-amp; LM741CN; 8-pin DIP
1 ea Perfboard; pre-cut, notched, trimmed to size
1 ea Shielded cable; 3-ft; w/RCA plug
1 ea Detailed printed instruction set, complete with
graphics, photos, tables, and "what if's"...
1 ea 3.5" floppy disk w/shareware & freeware decoder
programs and utilities.

Optional upgrade or add-on items:

* A. Shielded cable; 6-ft; w/RCA plug + $2.00
* B. Shielded cable; 12-ft; w/RCA plug + $4.00
C. Port Adapter; DB25 male-to-DB9 female + $7.50
(adapts 25-pin Interface to 9-pin comport)

* Instead of the standard 3-ft cable w/RCA plug

-=OR=-

2. Assembled/tested 2-L Decoder Interface $40 + $8 S&H

Includes:
1 ea Data Decoder Interface built into a DB25 shell
with standard 3-ft shielded cable w/RCA plug.
1 ea Detailed printed instruction set, complete with
graphics, photos, tables, and "what if's"...
1 ea 3.5" floppy disk w/shareware & freeware decoder
programs and utilities.

Optional upgrade or add-on items:

A. Built with 6-ft shielded cable and RCA plug + $2.00
B. Built with 12-ft shielded cable and RCA plug + $4.00
C. Port Adapter; DB25 male-to-DB9 female + $7.50
(adapts 25-pin Interface to 9-pin comport)
D. Custom enhancements/designs per your specs +$10/up

4LFSKDDI
========

CAVEAT: It may be illegal to decode certain 4LFSK signals.
You must determine that for your self and cease
interest in the subject if not legal in your area.

If you are intested in a 4-Level FSK Data Decoder Interface
we have a detailed Instruction Set ready to go, as well as a
Kit of Essential parts, less enclosure and power supply.

Assembled and Tested units are not ready yet, but.....I may
have available some built/tested prototype units that have
been proved fit for consumption.

One or more of the following may be available:

1. Instruction Set Only - you build from it.
8-pages of hi-res laser printed text, charts,
photos, drawings, and detailed, hand-holding
guidance: Price: $5, ppd, USA; $7, ppd, foreign

2. Kit of Essential Parts, plus detailed Instruction Set
from (1) above, less enclosure and power supply. See my
4LFSK.FAQ file for details, or the following web site:

http://ourworld.compuserve.com/homepages/bcheek/4lfsk.txt

Price: $20 + $8 S&H, USA; $20 + $15 S&H foreign

3. Kit of Essential Parts, incl power supply. Price: TBA
4. Assem/Tested 4LFSKDDI, no power supply: Proto: $125 + $8S&H
5. Assembled/Tested 4LFSKDDI, incl power supply. Price: TBA

TO ORDER: Use e-mail, fax, or postal mail per the
information in my signature box below. MC/VISA or
M.O. preferred. Personal and company checks okay,
but shipment delayed until bank clearance. No
COD's and no shipments to PO Boxes or mail drops.
Alaska, Hawaii and foreign shipping extra.

TERMS: All sales are final; no returns-no refunds. 30-day
Performance Warranty on the Assembled/ Tested
Decoder Interface is strictly limited to Motorola
SmartNet trunked data signals using TRUNKER.EXE
despite that it will work on many other kinds of
data, too. We just can't support it all. Repair
or replacement at our option during that 30-day
period. No warranty on Kits.

Not responsible/liable for illegal use of this
information and/or these products; nor for any
consequences thereof. You must determine
lawfulness of these products for your applications
and region and not use them, if illegal.

Use of this information and/or these products is
100% exclusively at your own risk.

You must determine suitability and fitness of
purpose of these products to your needs. I will
not accept responsibility or liability for any
damage or loss that results from use of these
products, nor for damage or loss that results from
connecting these devices to a scanner and/or a
computer.

You must determine all risks and accept all
consequences of any damage to hardware and/or data
stored in the computer.

==========

That's it for now. I will keep this FAQ updated. If you see things that need to be added to it, by all means, let me know. If this FAQ fails to address your question(s), then hit me with 'em again, but be specific. And be detailed with symptoms and observations if you need tech support on mods or troubleshooting and diagnosis. Use e-mail.

Ouch Bill....If you had a gun and a mask that would be robbery. Texas 2-Way has the DDM-4 4-Level FSK decoders for $69 and they only require a simple single polarity power supply (like $12 at Radio Shack)! Their's comes in a nice case with all the stuff you need for power hookups and connecting to your scanner and computer.

You can call Texas 2-Way at (956)702-2481 or email them at n5sim@aol.com

There are at least three different versions of the PRO-2026. They can be differentiated by their catalog numbers, 200-0148, 200-0148A, and 200-0148B.

The 200-0148 is generally modifiable for cellular frequency reception, but has a fixed three-wire ribbon cable snaking out of the back of the scanner. This was meant for permanent vehicle installation (one power, one memory, and one ground wire). Because the installation was meant to be permanent, there is no memory retention built into the scanner. An easy way to add memory retention is to get a 9VDC battery snap. Attach the positive lead to the 12VDC memory lead, and attach the ground lead to the ground (black) wire. Now, attaching a battery will keep the memory for weeks while the scanner is moved about.

The 200-0148A is generally modifiable for cellular frequency reception. The permanently-wired power cord has been replaced with a 12V coax jack. This is the most desirable of the PRO-2026s.

The 200-1048B is like the 200-0148A, with the exception that it is not modifiable for cellular reception. (No L201 on the circuit board)

The PRO-2026 of choice seems to be the 200-0148A, or any unit with the date code of 11A3. These units are cellular modifiable, and come with the coax jack and memory retention features.

The Pro-2026 has cellular frequencies deleted at the factory, but restoration is easy! Just
clip one marked wire. All you need is a Philips screwdriver and wire cutters.

1. Turn the scanner upside-down and remove the four side screws holding the bottom
cover in place; pull the cover loose and set it back about two inches out of the way.

2. Locate the small circuit board at the lower right-hand corner and find jumper L201. (I have been informed that the "B" post mod version does not have an L201 jumper. The circuit board is bare where it should be.)

3. Cut the L201 jumper and slightly separate the break.

4. Reassemble the radio which now has continuous 806-956 MHz coverage and 30 KHz
search increments in the cellular band.

John:

The small Radio Shack (#21-549B), for around $10.00, works very well for communications reception. If you want more fidelity, consider one of their Optimus series. I picked up a #40-2080, PRO-X44AV, on sale, for around $27.00, works great!

Grove also carries several good speaker options!

I am new to the scanner world. I live in Canada but I am just about to move to Colorado Springs. I am thinking of buying an ICOM R2 for a first scanner. Is that wise? As they are inblocked here in Canada does that make it illegal in the States? Is there a more appropriate scanner for a beginner at around the $200 mark?

Thanks

3964. Might Florida Law Enforcement Going Digital Violate the Sunshine Law?

Newsgroup: rec.radio.scanner
Date: 1999-03-13 00:00:00 UTC
From: cbrambo@aol.com
Message-ID: <19990313122509.11481.00000237@ngol02.aol.com>
Source record: 125184

Just had an idea...

Here in Florida, I have watched with dismay and disgust as FHP and other law enforcement agencies continue to switch to digital, "closed" systems. Regardless of their double-speak, we all know the REAL reason for their doing this is so that their communications cannot be monitored by the public. You know, the taxpayers who pay their salaries and who have now had to spend untold millions for their new Astro and similar digital systems.

Question: might this not violate the provisions of Florida's "Sunshine Law?" For those who are not familiar, the "Sunshine Law" mandates that all public business be conducted "in the open" and not in a manner that is closed to the general public.

Discuss, please.

> listening and meddling in other's private
>conversations.
If you broadcast your telephone calls over the public airwaves it is not, never has been, never will be private. All the laws passed will not make it so.

>Which means that you also support the
>>right of others to listen to your own private conversations.)
When I use my cellular RADIO telephone, I am careful not to give out any sensitive or personal informatio as it is a RADIO not a telephone and it is not private if you broadcast you conversation over the public airwaves.
I would rather have some guy in his basement listening to my cellular than have the government listening to me.
Nothing is truly private from big brother.

I have a Radioscanner Uniden Bearcat 230 XLT,that probably
are sold in USA,and the frequensy-band 66 Mhz to 88 Mhz are
missing.In Sweden that band are present,because the policeradios
operates on 79 Mhz.
Is it possible to rebuild the scanner in some way to operate at
that frequensyband,and were can I buy a schematic for the scanner.

I am also looking for a computer software to decode the digital
transmission between cordless phones(dect phones),and digital
cellular phones the GSM standard.

3982. pro 2005 dx394 info please!!

Newsgroup: rec.radio.scanner
Date: 1999-03-14 00:00:00 UTC
From: "Andrew.Lomas" <andrew.lomas@virgin.net>
Message-ID: <7che9cdhh1@nclient3-gui.server.virgin.net>
Source record: 125002

Hello and thanks for reading...
anyone have the actual circuit diagram (not blocks!) for Realistic PRO 2005
and DX 394 HF receiver, as a bitmap image or jpeg file? i'd appreciate a
really good quality copy of this by email if possible!

Best regards
Andrew

3983. Buying a Used Scanner Radio

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET groups
rec.radio.scanner, alt.radio.scanner, and rec.radio.info.
It is also available electronically from the
rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article discusses the purchase of used scanner radios
and includes these topics:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other

radio hobbyists.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Radio Shack repairs scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series (see US patent 4,011,515, granted 3/8/77). Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Tennelec MCP-1 (see US patent 3,961,261, granted 6/1/76), Bearcat BC-101 (see US patent 4,179,662, granted 8/4/78), and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. See US patent 4,057,760, granted 11/8/77. The GRE-manufactured SBE Optiscan (and its Sears clone) required poking or covering a series of holes in

plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to

cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

Electra Corporation stocks crystals for the Bearcat scanners:

Electra Corporation
11915 E. Washington St.
Cumberland, IN 46229
Phone 317-894-3229

Crystals for Bearcat and other models are available from:

American Crystal Co.
1623 Central Ave.
Kansas City, KS 66102
tel. 913-342-5493

Bomar Crystal Company
201 Blackford Ave.
Middlesex, NJ 08846
tel. 908-356-7787

Cal Crystal Lab Inc.
1142 N. Gilbert St.
Anaheim, CA 92801
tel. 714-991-1580

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

G & G Communications
9247 Glenwood Drive
LeRoy, NY 14482.
tel. 716-768-8151

Jan Crystals
Box #-6017
Fort Myers, FL 33911

FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA.
High level overviews of the following topics are presented:

Why Scanning?
Is Scanning Legal?
What Scanner Should I Buy?
What is a CTCSS and DCS Tone Squelch Feature?
How Do I Determine the Proper CTCSS or DCS Code?
Scanner Antennas
Coaxial Cable Feedlines
Where Can I Buy A Scanner?
Modifying Your Scanner
Scanner Repair Shops
Where Can I Obtain Frequency Information?
Do Your Own Frequency Detective Work
How Can I Use Equipment to Uncover New Frequencies?
Scanner Clubs and Mailing Lists

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,

taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies.

It is illegal for companies to sell or import into the USA recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

The rules define "readily altered by the user" as "clipping the leads of, or installing, a simple component such as a diode, resistor and/or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip

using special access codes or an external device, such as a personal computer."

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations and the AR5000 works well.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. Beware of low cost programmables which can't search. Some of the newer models, like the Uniden SportCat and Radio Shack PRO-2046, allow searching between limits, but the limits are factory programmed and cannot be altered.

Get a model which covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 50 channel scanner will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate. The $2000 Icom R8500 and AOR AR5000 models are exceptions.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, BC230XLT, and Radio Shack PRO-43 and PRO-60 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites.

Looking for value? At $180 discount price, the 100 channel Uniden/Bearcat BC860XLT base is a good value and available at most Wal-Mart stores. The RELM HS200 portable performs very well is an excellent value at its $250 street price.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 was replaced by the 1000 channel PRO-2035, which was replaced by the PRO-2042. The portable Radio Shack PRO-64 and PRO-60 are good performers. All five models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

CTCSS and DCS Tone Squelch Feature

Upscale scanners can be optioned with a subaudible tone decoding squelch circuit. There are two types: CTCSS (Continuous Tone Coded Squelch System) and DCS (Digital Coded Squelch). In simple terms, this feature lets your scanner ignore signals you don't want to hear.

Most land mobile two way radios, except trunked systems, transmit either CTCSS or DCS signals subaudibly along with the voice information. U.S. military field radios employ wider deviation and a 150 Hz CTCSS tone, not supported by most scanners or CTCSS decoders.

There are over 40 different CTCSS codes and you can program a specific CTCSS or DCS code into each memory channel. Using a CTCSS or DCS decoder permits your scanner to open the squelch only if the transmission has a code which matches the code you program.

CTCSS and DCS decoding offers several advantages:

1. Ignore unwanted signals on shared frequencies: It is common for several users to share the same frequency, e.g., my county sheriff uses the same frequency as Chicago Police, located about 60 miles away. I want to hear my sheriff's transmissions but don't want the scanner to stop on or listen to Chicago Police transmissions. This is especially a problem when radio propagation is good, e.g., during a "band opening," when reception range is temporarily increased.

2. Combat intermodulation interference: Helps keep out intermod and image interference from strong pagers and other signals which are not transmitted with a matching code.

3. Ignore scrambled transmissions: Many federal law enforcement agencies (FBI, Secret Service, etc) and some local police agencies employ digital voice scrambling, which sounds like white noise and is annoying to hear. The CTCSS or DCS code is sent only when the station is transmitting unscrambled, or "in the clear." You can program federal frequencies along with the proper code into your decoder-equipped scanner so you won't have to listen to the scrambled mess and only hear their transmissions when they are unscrambled.

CTCSS also goes by various tradenames: Motorola's PL (Private Line), GE's Channel Guard, and RCA's Quiet Channel. Motorola uses the tradename DPL (Digital Private Line) for its digital coded squelch.

How Do I Determine the Proper CTCSS or DCS Code?

There are a few ways to determine the CTCSS or DCS code transmitted by a station:

1. Use an outboard CTCSS/DCS reader which must be attached to the discriminator output circuitry inside the scanner. The reader has an LCD or LED display which indicates the code when a station transmits. I use a CSI model CD-1 Communications Decoder Unit, an an excellent reader which sells new for about $200. (Connect Systems Inc., Ventura, CA, 800-545-1349, www.connectsystems.com).
2. Many of the ScannerMaster guides, as well as scanner club newsletters, print the CTCSS codes used by transmitting stations.
3. On some scanners equipped with the CTCSS squelch, you can program into memory the frequency of interest. Then you "tune" slowly through all the different CTCSS and/or DCS codes until the squelch opens and you hear the dispatcher talking. This is a slow process and the station has to keep transmitting during it.
4. A slow, brute force method is to program the same frequency but a different CTCSS code into several channels and see where your scanner stops.
5. In some cases, I've actually examined the walkie-talkies I want to monitor and found the CTCSS code printed on a label on or inside the radio.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer these alternative antennas for use with portable scanners:

1. The Icom FA-1433B dual band flex antenna, a thin and very flexible rubber antenna, is slightly longer than a stock heliflex but provides better performance.
2. The Austin Condor is a 12" long rubberized antenna available for about $30. While considerably longer than the stock antenna and the FA-1443B, the Condor is very flexible and provides VHF-high band reception superior to both. It is not designed to cover the VHF-low band, but will allow reception there at least as good as shorter antennas. The Austin Condor is available from Grove Enterprises.
3. The "Thin-Stick" is an 18 inch telescoping antenna for

extended range. It is made in USA by Smiley Antenna Co., Inc. and is designed to cover both the 2 meter and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A (available from Amateur Electronic Supply) or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 50 miles or more, depending on terrain. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U, e.g., Belden type 8267, has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Be sure it is on sale, as Radio Shack list prices are high and their scanners are offered at reduced prices by mail order discounters.

Discount chain stores like Wal-Mart, Best Buy, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902. For a free catalog, call (828)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove-ent.com

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is http://www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411. Web page is http://www.aesham.com

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/hamradio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then

copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

For information on "virtual downconverter" modifications, see Steve Donnell's article in January 1995 RCMA Scanner Journal or February 1996 Monitoring Times. Reprints of articles from Monitoring Times are available for $3.00 each plus a self-addressed stamped envelope from:

Grove Enterprises,
7540 Highway 64 West,
Brasstown,
NC 28902. For a free catalog, call (828)837-9200.
Telephone (orders only): (800)438-8155.

I don't get any part of this reprint fee.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - (www.iinc.com/ggcomm or email ggcomm@iinc.com or ggcomm@aol.com) This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 7825 Black Street Rd., LeRoy, NY 14482.

Repair tips for Bearcat and Radio Shack scanners are discussed in two other FAQ articles.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Plus, published each year in 9 regional volumes by Hollins

Radio Data, and sold at Radio Shack and larger book stores. The newest editions contain abbreviated business listings, too, although callsigns and other details are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 828-837-9200, www.grove.net) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning (NatScan) is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. Early issues disappointed experienced scanner hobbyists, but it now has a good column on scanner modifications and has greatly improved its coverage of east coast frequencies since merging with NESN (North East Scanner News). The best scanner frequency

lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM for $100. In the 1995 edition, fields are different than PerCon's Spectrum CDROM but the data appears to be of the same vintage. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the

scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Peter Laws administers an electronic mail list read by over 700 hobbyists devoted to scanners and scanning. It's called "scan-l" and for more information, read:

http://www.wildstar.net/~plaws/scan/scan-l.txt

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. You can obtain an electronic subscription to the CARMA Newsletter. For more info, see:

http://www.TheRamp.net/shabec/carma.htm

The club's mailing address is:

CARMA
P.O. Box 2681
Glenview, IL 60025

All 1999 meetings (except August) will be held on Saturdays at Phillies Pizza, 6300S. Kingery Highway, located in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook, IL,

The 1999 meeting schedule is: April 3, June 5 (picnic at Argonne National Labs), August 7, October 2, and December 4.

The CARMA Picnic will be June 5th, 1999 at the Argonne National Labs Picnic Pavilion, Cass Avenue, south of I-55 in or around Darien or Lemont. The picnic will start whenever someone arrives. The regular meeting will be in the Pavilion at 1:00 PM. If the weather is totally frightful we also have a room inside the Laboratory building available for us.

The Picnic is BYOE (Bring your own everything) If you want to eat or drink, bring it with you, as well as your BBQ or six pack.

What Makes Station Identification Difficult?
Examine the FCC License on Premise
Examine the Labels on Radio Equipment
Examine the Antenna to Determine Frequency Band
Equipment to Determine Frequency Usage
How Can I Determine To Whom I'm Listening? - An Example
Summary
Addresses

Books

The most convenient source of fire and police frequencies is the Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and

larger book stores for under $13. Police Call Plus is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. A few pages of local airport and nonsensitive federal government frequencies are included. Selected business frequencies are listed, too, but without callsigns and other details.

I highly recommend Richard Barnett's book, Monitor America, published by Scanner Master Corp. A 3rd edition is available from Grove Enterprises for about $30. It is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the Radio Communications Monitoring Association (RCMA), now defunt. Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call Plus, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The longstanding source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It

is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and the sensationalistic Popular Communications magazines.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $49 instead.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

The PerCon Spectrum CDROM sells for under $30 and contains a handful of fields for every FCC license in the US. However, Public Safety license information contained in the Winter 1996 Spectrum doesn't appear as up to date as in the 1997 Police Call Plus.

Spectrum works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at

http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Web Sites

If you have access to the World Wide Web, you can visit dozens of sites with local frequency lists. You can look up civilian aero frequencies for specific airports at: http://www.airnav.com/airports/.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. (See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available on the WWW page http://aosc.rpmdp.com and from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio,

or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at

the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was

permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Examine the Antenna to Determine Frequency Band

You can often determine a transmitter's frequency band by the size and type of antenna used.

The Police Call Plus book contains sketches of antennas. Antenna catalogs are crammed full with antenna pictures and specifications and they are usually free. Contact Antenna Specialists (216-349-8400), Cushcraft (603-627-7877), Tessco (800-472-7373), Maxrad, Larsen Electronics (800-426-1656), and other companies in the land mobile equipment business.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and

store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi

antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 1999 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

One way to roughly estimate a radio's age is to examine the
4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most

recent date stamp.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation sells crystals, |
antennas, power cords, owner's manuals ($11 ea) for some |
older (pre-Uniden) Bearcat scanners. Electra Corporation
is located at 11915 E. Washington St., Cumberland, IN
46229. Phone 317-894-3229.

I cannot furnish schematics, manuals or parts. To order a
user manual for an Electra/Bearcat scanner from Uniden,
call (800)235-3874 extension 2553. You can also download
an electronic copy of the user manual for recent Bearcat
models from the Uniden web site:

http://www.uniden.com/docs/service/support.htm

Some schematic diagrams may be obtained from Uniden's parts
department, (800)297-1023. Uniden currently charges a flat
rate of $54 for scanner repairs. They will repair and
return "out of warranty" items without an estimate unless
the repair charges exceed the flat rate charges.

The phone number for repair is (800)297-1023, too. I
recommend you call repair before sending the broken
scanner. Items for repair via UPS (include receipt if
still under warranty) are usually sent to:

Uniden America Corp.
4700 Amon Carter Blvd.
P.O. Box 95002
Fort Worth, TX 76155

If Uniden doesn't have a schematic, try obtaining a
Photophacts from Howard Sams Publishing division of
Prentice-Hall at (800)428-7267,
http://www.hwsams.com/sams_model_new.html

G & G Communications (telephone (716)768-8151) is a family
owned company which repairs scanners and stocks parts for
several older models, especially Electra/Bearcat and
Regency brands, but they don't sell manuals or schematics.
They are located at 7825 Black Street Rd., LeRoy, NY 14482.
(http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or
ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models
were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF,
and audio stages, and

2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Matt Roberds fixed a BC220 which experienced memory loss if power was removed by resoldering the positive wire to 2-AA battery holder.

As built, the BC220 logic board is grounded only through its mounting screws. In the BC220, Matt recommends adding real wire ground jumpers from the main board to the feature (logic) board to fix grounding problems.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. See March 1996 Monitoring Times magazine for BC800XLT capacitor locations and repair information.

The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

Jim Craig replaced a 22uF/35V C98 capacitor to repair his BC210XW.

Paul Grohe replaced a failed C98 with a low ESR (equivalent series resistance), high frequency, switching regulator grade capacitor, e.g. a Panasonic HF series capacitor. He also recommends adding a 0.1 ceramic capacitor in parallel with C98.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Failure of IC9, the 9 volt NJM78M09A regulator in a BC800XLT is another cause of a blank display.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of

a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Matt Roberds repaired the Montgomery Wards version of a BC220 and contributed these insights:

"I did add some heat-sinks, but you have to be careful what you do with the TIP29 on the logic board. I added a long, flat heatsink to it and immediately created a whine in the audio. I didn't use an insulator, as this was a temporary first-try. As far as I can tell, the heatsink was radiating noise from the logic board into the front end on the radio board, which ended up being just below the heatsink. Bypassing the TIP29 (a voltage regulator) with disc ceramics didn't work; using a smaller heatsink and an insulator fixed the problem."

"There is also a 220 ohm 1/4 watt resistor on the logic board. It feeds the TIP29 from the main +16v supply. It looked a little crispy. I pulled one end and measured the current through it and it was about 30-35 mA. This works out to right at 0.2-0.25 watt dissipation. I didn't have a higher-wattage resistor, so I substituted 2 470-ohm resistors in parallel."

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there is no audio and the green backlight no longer functions, a tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201 (2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC to several stages of the BC200XLT. Its main purpose is to

switch off power hungry stages of the BC200XLT when the CPU thinks the NiCd voltage has fallen below a threshhold. That's an attempt to limit the current drain on weak NiCds to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board, adjacent to the black multi-pin connector which mates the Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily, by something in the scanner drawing too much current through it. In one case, capacitor C36 shorted. It's a 220 uF 10v electrolytic, located on the component side of the main board, connected from pin 8 of the audio IC (IC2 NJM386SL) to ground. Capacitor C55 shorted in another BC200XLT. Gary Bean reports he substituted a 2SA1298 for Q201 and it worked fine. In a pinch you bypass Q201 by soldering a short piece of bare wire between the collector and emitter, but you must first fix the component which caused Q201 to fail.

BC9000XLT: Loss of Sensitivity

John Ward has fixed two BC9000XLTs which suffered from "low sensitivity." He fixed the solder joint where the antenna jack connects to the circuit board. In both cases the tab from the board was on the opposite side of the jack from where the little blob of solder applied at the factory was located.

It was an intermittent problem that depended upon the position of the antenna cable - if the weight of the cable placed tension on the jack in one direction contact was made and the radio worked fine. If the cable placed tension on the jack in the opposite direction contact was lost and so was reception. The gap was barely noticeable.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier activated relay inside the BC890XLT wore out. Andy found the identical relay sold at Radio Shack (part #275-232) and says the BC9000XLT uses the same relay, too.

Replacement Bulbs for BC760XLT

The Uniden BC760XLT's SCAN, MAN, PRI, and HOLD buttons are illuminated by "grain of wheat" type incandescent bulbs. Gary Saffer reports that the bulbs and buttons are located on a small printed circuit board which sits behind the radio's face plate. Gary unsoldered the burned out bulbs in his radio and replaced them with 12 volt Radio Shack bulbs (#272-1092c). They should last a long time when powered by the 8 VDC supplied by the BC760XLT.

Open Resistor in BC140

Robert Casey fixed his deaf, 16 channel Bearcat BC140 scanner. A 10 ohm resistor had opened that fed a circuit that generates 22V for the varactor diode tuner circuits. Without the 22V, there was no tuning of the local oscillator and front end, and no reception. What he did was compare voltages to a second working BC140.

Sources for Replacement NiCd Battery Packs

Replacement NiCd battery packs and inserts for the BC100XLT, BC200XLT, BC2500XLT, BC3000XLT, and other scanners are available from Uniden. I've purchased them at lower cost from:

1. Mr. NiCd - E. H. Yost and Company, 2211-D Parview Rd., Middleton, WI 53562. tel. (608)831-3443. email ehyost@midplains.net

2. Battery-Tech Central, 2818 Southland Street SW, Cedar Rapids, IA 52404-4141. tel. (800)267-3087 or (319)364-0855. email rlassoc@inav.net

Batteries Plus has stores across they country and some have rebuilt Uniden NiCd packs for under $20.

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

In the 1960s and 1970s, thousands of firemen and ambulance
squad members came to rely on their crystal controlled,
transistor Plectron and Motorola desktop monitor receivers.
They have now been replaced by battery operated portable
pagers, and the desktop models are often available at
hamfests in the $5 - $25 range. Since many are in rough
condition and need repair, a hamfest special is better
suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are
excellent for dedicated monitoring of local frequencies --
a task for which you wouldn't want to tie up your 400
channel programmable scanner. They are desktop models
which can be powered from 117VAC or 12VDC with the proper
mobile cord. The audio quality of a Plectron P1, Plectron
700 series, and Motorola Alert Monitor is far better than
any consumer grade scanner and the sensitivity, image
rejection, and intermod immunity is outstanding when
aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band
receivers: VHF-low, VHF-high, or UHF. No single Plectron
or Motorola Alert monitor can cover the entire 30-50 MHz

band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal

scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

The tape recorder inside the Receiver/Recorder employs two rubber belts. The Projector Recorder Belt Company makes replacement belts which work fine, though they may not be the original equipment:

1. PRB SCA8.6 (218 mm)
2. PRB SCQ 2.5 (64 mm)

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Crystals

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal fundamental frequency. Merely supply International with the exact receiver model number, printed on the rear label, and the frequency you want to monitor. They will perform the necessary calculations.

Crystals for Plectrons

The Plectron P1 series contain two crystals. The second local oscillator crystal is 11.155 MHz regardless of band. On VHF high band (148 - 175 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz)
= (station freq (MHz) + 10.7) / 4

or

Crystal frequency (MHz)
= (station freq (MHz) - 10.7) / 4

On VHF low band (25 - 54 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz) = (station freq (MHz) + 10.7)

or

Crystal frequency (MHz) = (station freq (MHz) - 10.7)

There are two crystals (Y1, Y2) used in the Plectron R700 series, one for each local oscillator. The crystal formulas are:

RF Range (MHz) Y1 (MHz) Y2 (MHz)
_____
25-29 (f+10.7)/3 11.155
29-32.6 (f+10.7)/3 11.155
32.5-35 (f-10.7)/2 10.245
35-41 (f-10.7)/2 11.155
41-47 (f-10.7)/2 11.155 (use 10.245 MHz
for Y2 on 44.62 MHz)
47-54 (f-10.7)/3 11.155
148-158 (f-10.7)/9 11.155
158-175 (f-10.7)/9 10.245
450-470 (f-10.7)/18 11.155

The economy Plectron 500 series use this scheme for the first local oscillator crystal:

RF Range (MHz) Crystal (MHz)

---

25 - 35 (f+10.7)
35 - 54 (f-10.7)
148 - 174 (f-10.7)/4

Most Plectron 500s use an 11.155 MHz second local oscillator crystal. However, a 10.245 MHz crystal is used instead for receivers in these ranges: 33.4 - 33.78, 44.62, and 158.78 - 158.82 MHz.

Power Cords

AC power cords for both types of receivers use unique connectors and are scarce. I published the pinout for both Plectron and Motorola Alert Monitor receivers in June 1998 Monitoring Times magazine.

You can buy the proper replacement power cords but it's much cheaper to drill a hole on the rear panel and solder on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

Squelch and Minimum Volume Setting

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely

silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760
email: weber@citizen.infi.net

You can also obtain Plectron repairs and parts from:

Northeast Communications
4 Oak Ridge Rd
Newfoundland NJ 07435
201-697-8804

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model UHF VHF-high VHF-low

SM-301 X X X
SM-302 X X

SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from
the crystals used in the conventional single channel
Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

Plectron Alternatives

Too bad Plectron is out of business. If you wish to
purchase a new receiver with "Plectron-like" signaling
capabilities, contact Reach Electronics:

Reach Electronics
1311 West Pacific
Lexington, NE 68850
(308) 324-6661
(800) 445-0007
FAX: (308) 324-4985

Reach sells tone & voice pagers, Alert monitors, and
ENCODERS. They also do contract manufacturing.

I currently have no Plectrons or Motorola Alert Monitors
for sale. I'm hoarding them. :-)

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1999 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

4. If space permits, you can replace the stock resistor with a higher value variable resistor ("trimpot") and adjust to suit.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver Model No.	Res-istor Value	Stock Comments
Radio Shack PRO-24	R35	33K replace with 220K. Located between pins 12 and 14

REPAIR TIPS: RADIO SHACK SCANNER RADIOS

Copyright 1997 - 1999 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also

archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

Radio Shack has been selling scanners and monitor receivers
under the Realistic and Radio Shack labels for over 30
years. Most of them were manufactured by General Research
Electronics of Tokyo, though many newer models are
manufactured by Uniden.

The date of manufacture is usually printed on a gummed
label on the scanner as well as the cardboard box. A code
of 12A5, means the scanner was made in the 12th month of
1975, 1985, or 1995, for example.

There's another way to date Radio Shack scanners
manufactured by Uniden. The first digit of the long serial
number is usually the last digit of the year of
manufacture.

Another way to roughly estimate a radio's age is to examine
the 4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most
recent date stamp.

Schematics, Owner's Manuals, and Parts Available

I cannot furnish schematics, manuals or parts. Service manuals for most Radio Shack scanners sold through mid-1997 may be ordered through your local Radio Shack store.

If Radio Shack doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

Parts lists for recent and many older models are available on line at: http://support.tandy.com. Parts may be ordered through Tandy National Parts, telephone (800)442-2425 or (817)870-5600, or through your local Radio Shack store

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

GRE-Built Base Models: Dim Backlight

The backlight in many base models, including the PRO-2022, PRO-2004, and PRO-2005/6 is implemented by an electroluminescent panel, which grows dim with use.

The EL panel used in the PRO-2005 and PRO-2006 is designated EL-501, and is identified by Radio Shack part #10800050. A new EL panel can be ordered through your Tandy National parts (see above) or local Radio Shack store and sent to your home. Radio Shack no longer sells replacement EL panels for the PRO-2004.

Replacing the backlight is an operation which requires care and patience. Purchase a service manual, and study the exploded parts diagrams as you read the following steps.

Top and bottom cabinet pieces must be removed, then the speaker unplugged from the main board. The front panel assembly must be removed from the chassis by removing 4 flat head screws, 2 on each side. You need not disconnect all the wiring harnesses, though you might have to unplug one so it won't get in the way of a hot soldering iron.

Unsolder the bare ground wire soldered to a large shield on the back of the front panel, located near the back of the squelch control. Two ground braids must be temporarily disconnected by removing the screws which fasten them to the chassis. After removing the volume and squelch knobs, you must remove 8 small screws which fasten the plastic front panel to the diplay board.

The old EL panel is fastened by a bead of glue and two foil type leads soldered to the display board. It's easier to cut the two leads from the old EL panel before unsoldering. A sharp knife should be used cut away the glue. The old EL panel can then be slid gently out from behind the LCD display.

The new EL panel can be installed by reversing the process, though I found that it is not necessary to glue the new panel. The two foil leads must be soldered using a minimum of heat. Reassemble the pieces in reverse order of disassembly.

GRE-Built Portables: Worn Out Keypads

The keypad on late model GRE-made Radio Shack portables, e.g., PRO-39 and PRO-43, can become unreliable after prolonged use. The best repair is to replace the rubber keypad instead of trying to restore contacts using chemicals. A replacement rubber keypad may be ordered inexpensively through Tandy National Parts or your local Radio Shack Store.

PRO-43: Loss of Audio

Early PRO-43s were built with a 200 mW speaker (mfr's part #EAS-3P123A). The voice coils in some of these speakers have opened, resulting in lack of audio output, though audio is still available from the earphone jack. A more capable 500 mW speaker is available through Tandy as replacement (EAS-3P127).

PRO-43: Freezup

If you attempt to lock out all 20 channels in a memory bank, then scan only that bank, your PRO-43 will freeze up and be placed into a catatonic state. Use the procedure documented in the PRO-43 user manual to fully reset the scanner. This will "break the trance," but all the memory channels will be cleared.

PRO-2004: Dead

If your PRO-2004 is completely dead, check R235, a 1 ohm, 1 watt resistor mounted vertically on the main board.

PRO-7A: Channels 1 - 4 or 5 - 8 Dead

If the first or last 4 channels in your 8 channel PRO-7A crystal scanner are not working and the lamps for those channels won't light, replace IC4 or IC5 (type 7400A).

group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than
70 old and new scanner radios and monitor receivers.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. This article
describes a few of the FM receivers in my collection, and
other models I've tested. It is not meant to be complete.

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass,
Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass,
Monitoring Times, May 1995.

I have published full length reviews and modifications of
these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004

Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements
Dec 1995 - Radio Shack PRO-2040
Jan 1996 - Plectron & Motorola Alert Monitors
Feb 1996 - Radio Shack PRO-2042
Mar 1996 - Tips for Fixing Bearcat Scanners
May 1996 - Compendium of Scanner IFs
Apr 1996 - Uniden/Bearcat BC220XLT, BC230XLT Portable
Jun 1996 - modifications & tips for the Uniden/Bearcat BC9000XLT
Jul 1996 - Uniden/Bearcat BCT-10 mobile
Aug 1996 - BMI Nitelogger II tape recorder activator
Sep 1996 - PRO-2022 modifications
PRO-2042 baseband audio tap
Oct 1996 - Radio Shack PRO-2046 mobile
Nov 1996 - Build a wooden mobile radio mount
Dec 1996 - AOR AR5000
Jan 1997 - ICOM R8500
Feb 1997 - Radio Shack PRO-2045
Mar 1997 - ICOM IC-R10
Apr 1997 - RELM HS-200 portable
May 1997 - Uniden/Bearcat BCT7 virtual downconversion mod.
Jun 1997 - Innovative Scanner Patents of the 1970s
Jul 1997 - Uniden/Bearcat BC235XLT portable Trunktracker
Aug 1997 - Radio Shack PRO-64 portable
Sep 1997 - Stridsberg Engineering receiver multicoupler,
G/Wiz board for EDACS trunked scanning
Oct 1997 - Radio Shack PRO-67
Nov 1997 - Sporty's JD-100 Air Scan
Dec 1997 - Uniden/Bearcat BC895XLT Trunktracker
Jan 1998 - Test Equipment Bargains
Feb 1998 - Innovative Scanner Patents of the 1980s and Beyond
Mar 1998 - RELM MS-200 mobile
Apr 1998 - RCA RP-6150 portable
May 1998 - Radio Shack PRO-2050 base Trunktracker
Jun 1998 - Opto DC442 CTCSS/DCS/DTMF display
Jul 1998 - Stub and Par Electronics intermod rejection filters
Aug 1998 - Sony SC1PC portable
Sep 1998 - Orange Book of Scanner Repair
Tone Out Testing (2-tone generators)
Monitoring ACSB (amplitude compandored side band)

Oct 1998 - AOR AR8200 portable
Nov 1998 - Alinco DJ-X10T portable
Dec 1998 - Radio Shack PRO-91 portable Trunktracker
Jan 1999 - AOR AR7000
Feb 1999 - Radio Shack PRO-2066 mobile Trunktracker
Mar 1999 - ICOM RS-8500 software for controlling the IC-R8500

Note: Reprints of Monitoring Times articles are available for $3.00 each plus a self-addressed stamped envelope from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this reprint fee.

ALINCO

DJ-X10T: 1998 vintage. Rugged construction - metal back. Multimode frequency coverage 0.1 to 2000 MHz (minus cellular bands). 20 selectable step sizes from 0.05 to 500 kHz. Knob atop the radio clicks when rotated and serves as a VFO knob, channel selector, and menu navigation control. Several battery pack options for NiCd and alkaline battery cases. Furnished with an EBP-37N 4.8 V, 700 mAH NiCd pack and a sturdy 11 hour drop in charging stand. Loaded with firmware features and complicated to use. Two VFOs and 1200 channels in 30 banks of 40 channels each. Memory banks are cryptically designated, though you can scan combinations of banks. Each memory channel can be programmed with the frequency, an 8 character label, attenuator, a skip (lockout) flag, and mode (WFM, NFM, AM, USB, LSB, CW, AUTO). Very slow 6 ch/sec scan rate. Rescan delay is about 1 second and cannot be disabled or changed. Auto Memory Write stores up to 40 frequencies but does not check for dupes. 20 linkable search banks with labels. Up to 50 frequencies per search bank can be locked out. Digital clock with on/off timer. Battery saver can be disabled. Ability to scan or search for signals above a selectable threshold or channels with a specific mode. Band scope 7 or 40 steps wide. In short, 30 - 1000 MHz sensitivity is good, few birdies and little intermod. WFM broadcast reception very good. The DJ-X10T squelch can be set to one of 10 levels. We had to keep the squelch set to SQ3 or higher, otherwise it opens at inappropriate times, especially when the battery saver is active. The DJ-X10T instruction manual does not specify the IF (intermediate frequency) scheme. Filters inside the DJ-X10T imply 0.455, 10.7, and 45 MHz IFs. Our tests indicate a first IF of 736.25 or 275.45 MHz, depending on the frequency to which the DJ-X10T is tuned. Our DJ-X10T hears images of cellular phone signals clearly in the 1419.9 - 1444.9 MHz range, 550.9 MHz above their actual frequency. For a full review, including technical test results, see Monitoring Times, November 1998.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features than any other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity, attenuator, AGC, deemphasis, etc. DB9 RS232C connector. Negatives include low contrast LCD display and difficult user interface. NFM squelch closes slowly, causing noise burst at end of each NFM transmission. Electromechanical relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio, otherwise. See "AOR's AR5000 All-in-One Receiver," by Bob Parnass, in Monitoring Times, December 1996, for a review which includes quantitative test results.

AR8200: 1998 vintage. S/N 550004 tested. Portable, high end "super" scanner covers 0.1 - 2040 MHz (minus cellular in USA version). Not a scanner for beginners. Many of the settings are made through the use of menus. Lots of features. 4 AA batteries, steel belt clip, plug-in AM antenna. 1,000 conventional channels in 20 banks, 10 temporary channels, one priority channel. Each memory channel may be programmed with frequency, label, mode, step, step-adjust, offset, attenuator enable, noise limiter, AFC, and write protect. Multi bank scanning. You can enable a 0 - 9 second rescan delay with each scan group, but not per channel. 40 pairs of search limits with labels. Offset capability for monitoring repeater input frequency. LCD display easy to read. Display and keypad backlit using green LEDs. The band scope. Shortwave reception stone deaf on shortwave when fitted with the supplied antenna or a 19" whip. Seriously overloaded on shortwave by a 132 foot long dipole unless we use the built-in attenuator. Supplied "dorsal fin" antenna for AM BCB. Scans slowly (14 channels/s). Requires more current. Audio quality is

slightly above other portable scanners. Computer port. One slot for a single plug-in option: voice inversion descrambler, CTCSS search, 256 frequency tone eliminator, voice recorder and playback, or extended (slow) memory. See AOR AR8200 review by Bob Parnass,in Monitoring Times, October 1998, for review with quantitative test results.

ICOM

IC-R10: late 1996 vintage (serial number 01048 tested). Shirt pocket size multimode is powered by 4 AA penlight cells. Covers 0.5 to 1300 MHz (minus cellular). NFM, WFM, USB, LSB, AM, and CW detectors included. IF bandwidths are fixed. No 30 kHz bandwidth for satellite or FM military monitoring. Battery saver circuit, with selectable duty cycle. Single VFO and 1000 memory channels. There are 900 memory channels divided into 18 banks of 50 channels each. Another bank of 100 channels used to hold unique frequencies found during an auto store operation. 20 pairs of search limits. Up to 100 frequencies may be locked out during a search and stored in a final bank of 100 channels which is cleared before subsequent auto store searches. Each channel can be programmed with the detector mode (e.g., AM, USB), a tuning step size, an attenuator enable flag, and an 8 character label. CI-V computer interface requires extra cost hardware. 7 segment S-meter. Noise blanker. Good sensitivity. Lighted keypad and display, but keystroke sequences are cumbersome.

Good radio hardware in a handy sized package, but scanning performance unimpressive. Very slow memory scanning at only 6 channels/second. Searches at about 16 steps/second, with little or no worthwhile improvement using the "Signal Navigator" feature in the R10 I tested. Rescan delay cannot be disabled. Can only scan one memory bank or all banks, not a combination of banks. No squelch for SSB or CW modes. See "ICOM IC-R10 Receiver," by Bob Parnass, in Monitoring Times, March 1997, for review which includes quantitative test results.

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new

frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the ICOM user with a very annoying clickety-clack, clickety-clack! For Baseband Audio out, I mounted an RCA jack on the back of the R7100A and connected it via shielded cable to the junction of resistors R228 and R230 on the Main Unit. This point is located in the vicinity of IC15 and X3 on the schematic.

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band. Second and third IFs are 10.7 and 0.455 MHz. Weak to moderate cellular images starting near 1106 MHz. Rugged construction. External power supply. DB25 RS232C connector. Audio peak filter. Ok scanning and great searching performance. See "ICOM R8500 Receiver," by Bob Parnass, in Monitoring Times, January 1997, for a review which includes quantitative test results.

UNIDEN/BEARCAT AND ELECTRA/BEARCAT

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency

of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout. See US patents 4,092,594, granted 5/30/78 and 4,114,103, granted 9/12/78 for further insight.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. See US patent 4,270,217, granted May 26, 1981. LED readout. Good scanner, but tinny audio.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC230XLT (Uniden): See BC220XLT.

BC235XLT TrunkTracker(Uniden): 1997 vintage. Portable with 300 channels in 10 banks. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. A query feature identifies duplicate memory channels. Very fast scan and search rates. Scans 64 channels/sec and skips empty channels. Service search. Data skip. Triple conversion, 254.4, 10.85, 0.45 MHz IFs. Excellent image rejection and intermod immunity. Fairly good audio. See "The Uniden Bearcat BC235XLT," by Bob Parnass, AJ9S, in Monitoring Times, July 1997 or an on-line version at http://www.grove-ent.com for a review which includes quantitative test results.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels See US patent 4,270,217, granted May 26, 1981. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100

components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite. See US patent 4,409,688, granted 11/11/83 for further insight.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC895XLT TrunkTracker(Uniden): 1997 vintage. Base with 300 channels in 10 banks. Covers military air band, but other frequency coverage is limited compared with the BC9000XLT. Predetermined AM and NFM modes not selectable. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. Weather alert siren. Built-in CTCSS decoder and tone finder. A query feature identifies duplicate memory channels. Test unit scans 85 channels/sec and skips empty channels. Triple conversion, 380.8 or 254.4, 10.85, and 0.45 MHz IFs. 800 MHz images in commercial and military air bands attenuated over 35 dB. For technical test results and a review, see "The Uniden Bearcat BC895XLT," by Bob Parnass, AJ9S, in Monitoring Times, December 1997.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. For a full review, see "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times. See US patents 4,947,456, granted 8/7/90, 5,163,161, granted 11/10/92 and 5,212,817, granted 5/18/93 for further insights into fast scanning and searching implementation.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan,

search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. NiCd pack provides about 5 hours between charges. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

REGENCY

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band

scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. See US patent 4,057,760, granted 11/8/77. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels

are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Z60: base/mobile sporting 60 channels, but 10 of them are for FM broadcast only. Built in alarm clock, priority, and memory which requires no battery backup. Covers 30 - 50, 88 -108, 118-136, 144-174, 440-512 MHz. Notice that it's not spec'd to cover some important federal bands: 136 - 144 and 406 - 440.

RCA

RP-6150: 1997 vintage. No frills, good performing portable. 200 channels in 10 banks. No military aircraft frequency coverage. Triple conversion and a flexible battery arrangement. Lacks duplicate channel detection, search skip, and empty channel lockout features of newer designs. Our sample isn't super sensitive at 470 - 512 MHz and has some intermod around the VHF railroad channels but is generally more resistant to image problems than the BC230XLT. For technical test results and a review, see "The RCA RP-6150 Portable," by Bob Parnass, AJ9S, in Monitoring Times, April 1998.

RELM

HS200: 1996 vintage. Very good 200 channel portable. 10 banks. Built-in CTCSS and DCS decoder. Lighted keypad. Duplicate channel detection. 100 frequencies can be locked out from search. Very good audio and strong front end. Excellent internal shielding. Global rescan delay. Covers CB. Fixed modes and step sizes. IFs are 280.2 and 0.45 MHz, and perhaps one in between. See "The RELM HS-200 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1997, for a review which includes quantitative test results.

MS200: 1998 vintage. Made in USA. 200 channel mobile with alpha labels. CTCSS and DCS decoding squelch. Programmable via PC using supplied software. Low contrast, LCD display. Keypad backlit for night programming. Rear panel tape audio jack. Test unit had lots of intermod on VHF-high band. IFs are 280 and 0.45 MHz. See "The RELM MS-200 Scanner," by Bob Parnass, AJ9S, in Monitoring Times, March 1998, for a review

which includes quantitative test results.

RADIO SHACK

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 crystal controlled portable bearing the same model number.) Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were

used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range. IF frequencies are specified at 608.005 - 611.2 MHz, 48.5 MHz, and 455 kHz.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-62: 1994 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO-64: 1997 vintage. Good portable 400 channel scanner using up conversion. Replaces PRO-62 and has many more features. Selectable AM/NFM modes but fixed step sizes. 10 search banks which can be cascaded. Auto store saves unique frequencies found during a search. Frequencies can be loaded using a computer but optional interface kit not yet available. Can recharge Radio Shack's optional, monolithic NiCd pack, but not AA cells within the scanner. IFs are 257.5, 21.4, and 0.455 MHz. See "The Radio Shack PRO-64," by Bob Parnass, AJ9S, in Monitoring Times, August 1997, for a review which includes quantitative test results.

PRO-67: 1997 vintage. Good portable 200 channel scanner using up conversion. Replaces PRO-51 and has better image rejection and super fast scanning. Service Search lacks police frequencies. Fixed AM/NFM modes and step sizes. Can lock out up to 20 frequencies during a search. Can recharge AA cells within the scanner. Frequencies adjacent to the cellular phone bands censored so our PRO-67 will not receive 868.9625 or 823.9625 MHz. Intermediate Frequencies are 254.4, 10.85, and 0.45 MHz. See "The Radio Shack PRO-67,"

by Bob Parnass, AJ9S, in Monitoring Times, October 1997, for a review which includes quantitative test results.

PRO-91: 1998 vintage. Portable made by Uniden for Radio Shack. 150 channels in 5 banks. Can selectively follow conversations in 800 MHz Motorola trunked radio systems. Censors 823.975 - 823.95 and 894.0125 - 896.1 MHz covered by the BC235XLT. Powered by four individual AA alkaline or NiCd batteries. Power save feature. Program key. One priority channel/bank. One search bank. Direct search. Service search omits many police freqs (inc. 460 - 460.5 MHz). While connected to an outdoor antenna, our PRO-91 experiences intermodulation interference in the 161 MHz range from a paging transmitter on 158.1 MHz. IFs near 380.7, 10.85 and 0.450 MHz. See PRO-91 review by Bob Parnass, in Monitoring Times, December 1998, for review with quantitative test results.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan.

Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Somewhat prone to intermod in the 460 MHz range. Cellular images throughout the 847.6 - 869 MHz range. See September 1996 Monitoring Times for modifications.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The

Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2045: 1996 vintage. Very good 200 channel base/mobile made for Radio Shack by Uniden. Tuning/channel selector knob. 10 banks, selectable attenuator, and rescan delay. CTCSS-capable with optional board. Great Auto Store. Weather alert. Scans and searches fast. Can lock out 50 frequencies during search. Step sizes fixed but AM and NFM modes are selectable. IFs are 380.7, 10.7, and 0.455 MHz. Images on VHF-high band despite high 1st IF. Some intermod on review unit. See "The Radio Shack PRO-2045," by Bob Parnass, AJ9S, in Monitoring Times, February 1997, for a review which includes quantitative test results.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels.

Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in Monitoring Times, October 1996, for a review which includes quantitative test results.

PRO-2050: 1998 vintage 300 channel Motorola trunk system tracking base made by Uniden. Tight front end. Excellent performance. Chassis-less, plastic construction. Squelch and volume knobs too close and Manual key is hard to find. IFs are 380.7 (approx.), 10.85, and 0.45 MHz. AM and NFM modes are factory set and not selectable. 300 channels in 10 banks and a 2 second rescan delay may be programmed on a per channel basis. Query feature identifies duplicate memory channels. Our PRO-2050 scans at 78 channels/sec., skipping over empty channels. 10 priority channels. Up to 50 frequencies may be locked out from limit search. A single pair of limits may be programmed for a limit search. No Direct key or direct search facility. Factory preprogrammed frequencies for police, fire/emergency, commercial air, public service, and weather, but not marine. See May 1998 Monitoring Times for a review which includes quantitative test results.

SONY

SC1PC: 1998 vintage. Good RF and audio performance. Covers 25 - 1300 MHz, minus cellular phone. Selectable step size and mode. Computer control and downloading with software and PC cable provided. Powered by ordinary AA batteries. Provided CDROM includes both the scanner control program and the multi million record PerCon FCC license database. 10 banks ("pages" in SONY parlance) of 30 channels each. Per-channel 2 second rescan delay. Unlike the ICOM IC-R10, you can scan any combination of memory banks. You can lock out ("skip") memory channels from scanning. The frequency stored in a skipped channel will also be skipped during searches. One priority channel checked every 5 seconds. SONY's limit search is restricted to one pair of search limits, though computer control expands this to 20 linkable pairs. Band search lets you search through 17 bands programmed at the factory. Service search. A cache, termed Intelligent Memory, stores the last 10 unique frequencies that were active for longer than 5 seconds each. IFs (in MHz) are 600 (below 370 MHz), 232.5 (above 370 MHz), 45.0, and 0.455. See "The SONY SC1PC," by Bob Parnass, AJ9S, in Monitoring Times, August 1998, for a review which includes

quantitative test results.

SPORTYS

JD-100: 1997 vintage. Limited 20 channel scanner which covers civil and military air bands only. Good audio. Large display shows frequency only out to 2 digits. Slow scanning and odd keystroke sequences. No key press confirmation beep. Cannot lock out channels from memory scan. Powered by AA batteries. Battery saver circuit. See "Sportys JD-100 Air Scan," by Bob Parnass, AJ9S, in Monitoring Times, November 1997.

CRAIG (division of PIONEER)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

SONAR

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no

scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X		no	
FR105	6	X		no	
FR2512	24	X		no	
FR2513	24	X		no	
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2516	10	X		yes	yes
FR2517	10	X		yes	yes
FR2525	10	X		yes	yes
FR2526	10	X	X	yes	yes
FR2527	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

TENNELEC

Manufactured the first synthesized scanners. See US patents 3,961,261 and 3,962,644, granted 6/1/76 and 6/8/76 respectively. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel

programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state,

and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central

time. For a brochure, send SASE.

How to Obtain Copies of Patents

Printed copies of US patents may be purchased for $3 each, but you must know the patent number. Credit card orders are taken over the telephone by the Assistant Commissioner for Patents at (703)305-4350. Alternatively, you can mail a check or money order, made payable to "The Assistant Commissioner for Patents" to

The Assistant Commissioner for Patents
Washington, DC 20231

For more information about the US Patent and Trademark Office, call their automated information message system toll-free at (800)786-9199.

There are various patent servers on the world wide web, including IBM's server:

Should use an antenna designed for scanners. A simple, inexpensive but good first choice would be Radio Shack's "Window Clip Mount." You plug it into the scanner's BNC, and put your existing rubber-ducky antenna on it, and it attaches to the top (outside) of your car window.

Just getting your antenna OUTSIDE the car will make a huge difference in many cases.

You can also use the thing with CB's or other 2-way handhelds and their correct antenna...as long as they have BNC connectors. Costs about $20.

williams wrote in message ...

HAMFEST/COMPUTERFEST CALENDAR 1999 - NORTHERN ILLINOIS
last updated March 13, 1999 |

o Please report additions or changes to Bob Parnass, AJ9S, office phone: (630)979-5414, electronic mail: parnass@bell-labs.com. Thanks to Dennis Dale, Rick D. Wilson, Tom Harker, and ARRL for providing some of the information.

MARCH 1999

Mar 7 (Sun), Wheaton, IL - Giant Computer show (see below). Dupage County Fairgrounds.

Mar 7 (Sun) - Waukesha, WI. SEWFARS Swapfest. Info: Mary J. Adams, KB9IFF, tel. 414-358-1003. E-mail: mjadams@execpc.com.

March 14 (Sun): Sterling-Rock Falls ARS, Sterling, IL info: Lloyd Sherman, KB9APW, PO Box 521, Sterling, IL 61081-0521. tel. 815-336-2434, E-mail: lsherman@essexl.com

March 28 (Sun): Grayslake, IL - LAMARS hamfest, Lake County fairgrounds. All indoors. Admission $6 at gate, free parking. Setup at 6 AM, doors open at 8 AM. Info: tel. 847-272-8347. See http://www.lightwriters.com/nsrc/lamarsfest.htm (Small fest, but usually interesting - AJ9S.)

APRIL 1999

April 11 (Sun): Middleton, WI. Madison Area Repeater Association. 8 AM - 1 PM Middleton Conference Center, 1313 John Q. Hammons Drive Middleton, WI 53562. The Middleton Conference Center is located in Middleton, WI, near the west side of Madison, WI. From the intersection of Interstate 90 and Highways 12 and 18 near Madison's South-East corner, take Highway 12 West. Stay on Highway 12 until you reach Greenway Blvd. Exit to Greenway Blvd. and turn left. Then turn left on John Q. Hammons Drive. The Conference Center is attached to the Marriot which is clearly visible from the intersection of Highway 12 and Greenway Blvd. Talk-in Frequency: 147.75/.15. Info: Paul Toussaint, N9VWH, MARA President, prt@execpc.com. The MARA telephone voice mail (608)245-8890 . http://skywarn.ssec.wisc.edu/mara/swapfest

Apr 17 (Sat), Wheaton, IL - Giant Computer show (see below). Dupage County Fairgrounds.

Apr 18 (Sun), Orland Park, IL Giant Computer Show & Sale (see below). orland Park Civic Center.

April 25 (Sun): Galva, IL. Area Amateur Radio Operators Hamfest. When: 8 am until 2pm, April 25, 1999. Where: The National Guard Armory Tickets: Advance tickets $5 double stubs, at the door $5 single stub, No advance sales after March 25th. Outside flea market space available. Electri-city, available on a first come first serve basis. Bring your own extension cords. VE Testing will be available by appointment only. Talk in 145.4900 - 88.5 PL / 146.460 simplex. Breakfast and Lunch will be available and served by the National Guard Relief Members. For set up times, advance ticket sales or other information, contact: (1) Bill Anderson WB9TEW, 103 SE 2nd Ave. Galva, Illinois 61434-1854. tel. 309-932-3023, bill@inw.net. (2) Tom Davis N9OSP, 802 Rose Street, Kewanee, Illinois 61443. Tdn9osp@cin.net

April ?? (Sun): Stickney, IL. Dupage Amateur Radio Club, Hawthorne Race Course. Hours 8 AM - 2 PM. Setup 6 AM.

MAY 1999 |

May 1 (Sat), Cedarburg, WI - Ozaukee Radio Club Swapfest, | Info: Joe Holly, AA9HR, 1702 Holly Ln., Grafton, WI 53024, | 414-377-2137 |

May 2 (Sun), Sandwich, IL - Kishwaukee Amateur Radio Club | Hamfest, Sandwich Fairgrounds. Admission $?. Ends at 2 PM. | Talk-in 146.73 MHz. Info: Bob Yurs W9ICU, phone 815-895- | 3219, email: w9icu@tbcnet.com. (Nice mid-sized hamfest out | in country. Lots of tailgating. Few commercial exhibitors. | Always a good time. Fairly good restroom facilities - AJ9S). |

May 14, 15, 16 (Fri - Sun) - Dayton, OH. Dayton HamVention. | See http://www.hamvention.org |

JUNE 1999 |

Jun 6 (Sun), Princeton, IL - Starved Rock RC. info: Frank | Carraro, KF9NZ, PO Box 198, Leonore, IL 61332/ 815-856-3773. | http://www.qsl.net/w9mks/ E-mail: w9mks@qsl.net. (Usually an | excellent hamfest. Unlimited space outdoor flea market, | some indoor space, though few big name commercial vendors. | Crude restroom facilities. - AJ9S) |

Jun 13 (Sun), Wheaton, IL - Dupage County Fairgrounds. Six | Meter Club of Chicago. info: Joseph Gutwein, WA9RIJ, 7109 | Blackburn Ave., Downers Grove, IL 60516-3925. tel. | 630-963-4922 |

JULY 1999 |

Jul 11 (Sun), Peotone, IL. Kankakee Area Radio Society. | Will County fairgrounds. Admission $5 at the gate. Take | I-57 to Peotone Exit 327 (east). 146.94 MHz (-600) talk-in. | info: Don Kerouac, K9NR, 6311 East Flora St., Kankakee, IL | 60901. tel. 815-939-7548, E-mail: k9nr@juno.com. | http://www.geocities.com/capecanaveral/hangar/5711 For | Reserved Tables and Advanced Tickets, send check (payable to | KARS) and S.A.S.E. to: CHIP MOORE, K9IOC, 289 S. Euclid Ave. | Bradley, IL 60915, E-Mail: chipm@megsinet.net or to BILL | DESALVO, W9OQW, 403 Birch Dr., Shorewood, IL 60431. 815- | 744-5099. |

Jul 18 (Sun), Sugar Grove, IL. Fox River Radio League. | Waubonsee Community College. For tables, tickets, and | information: contact N9UZC James E. Von Olnhausen, | n9uzc@amsat.org, (630)-879-3042, FRRL, Box 673, Batavia, IL | 60510-0673. http://www.frrl.org/hamfest.html (good, small | to midsized hamfest. Easy parking. Modern restroom facili- | ties. - AJ9S) |

AUGUST 1999

Aug 7 (Sat) - Quincy, IL. Western Illinois Amateur Radio Club Ham Radio and Computer SWAPFEST 1999. 8:00AM to 2:00PM. The Eagles Alps Grounds (3737 North 5th Street) 4.5 miles north of downtown Quincy with easy access from US Highway 24. Admission $3.00 at the Gate ($2.50 in advance) per person, under 12 - Free. Cross-posted to: alt.radio.scanner,rec.radio.scanner,tnn.comm.pager

WinFLEX is a Windows95/98 program that allows you to decode pager messages
using a data slicer or 4 Level FSK decoder and a modified radio scanner.

WinFLEX Version 1.0 has the following new features:

Cut-and-Paste from WinFLEX to other applications.

POCSAG baud rate now displayed after capcode.

Filters can now REJECT capcodes.

Size of scrollback buffer is now configurable.

You can now log all decoded messages to a log file.

Keep Alive feature enables "off-the-air" notification.

Plus MANY other enhancements, features and bug fixes.

Check it out at...

http://www.geocities.com/ResearchTriangle/Lab/9339/

I bought a scanner antenna at RS a couple of weeks ago for just the reasons you mentioned. This one has a magnetic mount and comes with an RCA type plug and a BNC adapter I cut that off and put a regular BNC connector on, less hardware better performance. That BNC connector took me about 30 minutes to install but, was well worth the effort.

One instant and significant boost in performance can be accomplished by the following. Cut a 5ft hunk of 16ga speaker wire (although the gauge isn't real important). Terminate one end with a large alligator clip you can get at any Radio Shack. You can put a clip of any kind at the other end as it will be mainly for clipping onto a curtain or the like for orientation. Clip the terminated end onto the knurled end or just below the insulator of any metal based antenna on the handheld antenna. (Telescopic antennas are the best but even ducks will work as long as you place the clip on the knurled part of the BNC connector. This is where the telescopic antenna works best is that for frequencies below 100mhz, you place the clip below the insulator and for frequencies above you place the clip above the insulator or on the shaft. You should typically get 3 to 7 more lit markers on your signal strength indicator if you have a 10 element one. And you will notice much more quieting on the received signal. Total cost is probably less than 3 bucks.

I have the 20-043 discone with the vertical whip at the top and have been quite impressed. The whip that has been added in recent years seems to give the low VHF a good boost. If low VHF is a big deal, the 20-014 monster from radio shack is the stuff, but it was discontinued, it can still be found on e-bay.

From all I have seen, the Relm HS-200 is also a great radio for the money. ($159.00 at USASCAN.com) But figure on adding in nearly $20 for them to ship it. I'm not sure why CEI doesn't seem to be able to ship things at the same rates as everyone else, you'd think it was coming in a gold plated box...

Well I have an older scanner that has them built in from the factory and bought in the US. The manual even says how to scan for cell phones correctly. I will use what I buy in the way it was designed to be used. If I want to listen to a duplex walkie talkie on something that was designed to do that complete with instructions for doing it, I will. The US governement should not be in the business of telling people they can no longer use products that they have purchased in the way they were designed and directed in their instructions to be used.

And I have to agree -- the discone I bought a year ago (which appears to be different than the one they're selling today) and mine also has piss-poor reception.

It's coming off the roof this Spring, that's for sure.

Mike

How about when a police officer uses a land line so that what they say is not on the radio and private. Do you think that is breaking the sunshine law also? Same reasoning....Do you think they should not be able to use a land line when the want to?

There are, of course, exemptions to the Sunshine Law, and one of those exemptions is for material relating to an on-going police investigation. I suppose a good argument could be made that most communications deal with one type or another of investigation.
Still, there was a court case along these lines several years ago, the result of which is that the Hillsborough County Sheriff will sell to anyone a portable radio programmed to receive (not transmit) the primary dispatch channels, plus fire and EMS. The cost is approximately $1,100.

Source record: 125056
Cross-posted to: alt.radio.scanner,alt.radio.scanner.uk,rec.radio.scanner,rec.radio.shortwave

I've written 3 ActiveX DLL's + a basic control program for the PCR1000 that uses them. The program allows you to see what goes back and forth thru the serial port. It is VERY basic but the intention is to help others who may want to write some code as well. It's not an example of how to write code or how a web page should be set-up so please, only constructive criticism.

The program + all source code for the DLL's and the program are on my webpage http://www.campbell84.freeserve.co.uk

Please note that the code was written using VB6 + any wizard I could find.
It is 32 bit and only tested on Win98.
It's released as GNU software so it's free as long as your code utilising it is free as well :)
Remeber to backup your eprom before use.

Colin Campbell GM1LUZ

I use a Motorola Radius GM300 for scanning a specific set of VHF frequencies. Does anyone know if there are DTMF decoders available for squelching a particular channel until that code is received? l

4033. Spooks, spies, and more at 4phun-scanning@onelist.com

Newsgroup: rec.radio.scanner
Date: 1999-03-14 00:00:00 UTC
From: Victor Healey <fourphun@bellsouth.net>
Message-ID: <2ROG2.1324$pD6.4125554@news3.atl>
Source record: 125059
Cross-posted to: alt.firefighters,alt.radio.scanner,misc.transport.trucking,rec.radio.scanner

Have you heard about a unique mailing list for those who own scanning monitor radios?
Do you know how to make an undercover video?
How small can a video spy camera be and do the job?
How cheaply can you get one?
Do you know what the best recorders are and why?
Do you know were to get the components for a stake out?
Do you know why SCBA can add to a FF's stress while fighting a fire?
Do you know what the US military is doing to prepare for Y2K civil unrest in the USA?
Could a 98 year old woman harm you or your men?

All of this was discussed in the last two weeks on this uniqe mailing list at 4phun-scanning@onelist.com

Would you like to expand on you daily fix of information related to police, fire, or military scanning?
If you have a decent way to read email that contains rich text formatting, pictures, and sometimes sound then
you need to consider subscribing to the FREE mailing list 4phun-scanning@onelist.com . Microsoft's OUTLOOK and the free OUTLOOK EXPRESS pulling email from a pop account work perfectly.

We discuss anything high tech if it interests the group of scanner users, police and fire professionals who hang out on 4phun-scanning@onelist.com . When things are slow we discuss the reality of working in those fields so if you a kibitzing on the action with a scanner you can have a better understanding of what the pros are doing and why in a given situation. You will begin to understand much of the slang these pros use also when on the radio.

Some of the lurkers and posters are for real spooks and spies (and undercover LE like DEA) who use high tech radio in their work. We have set this list so that no one may read the identify of who subscribes for security reasons. The archive function of onelist also has been turned off for the same reason to protect the posters to this list from a computer search of the archives.

If you are in undercover LE, totally double blind posts can be made to this list by emailing proposed messages to fourphun@bellsouth.net so identifying headers can be stripped. This is for those who are totally paranoid about their identify. This makes sense since there are some real bad guys out there who would love to take out some of our users. Be warned sometimes the language is strong (rarely, yet it happens) Please consider that this some of these guys are dealing with the real low life of our society and it wears

off on them.

How do you subscribe? Go to http://www.onelist.com , sign up as a free member to onelist and then search for 4phun-scanning@onelist.com . There are actually 50+ lists related to scanning there, some regional as well as other lists for the pros like firemed@onelist.com . There is an excellent list there with breaking news heard by one of the members that beats the news wires in what may become major stories.

If you get subscribed before Thursday 3/18/99 you will see on that day a long but true account of Agent X's first bust as a cell fraud investigator. Agent X is one of our anonymous members with a rough and tumble background in LE.

The "Sunshine Law" specifically deals with public MEETINGS and ASSEMBLIES particularly dealing with "taxpayer issues", not public safety radio transmissions. Also when dealing with those meetings, as long as the politicians involved do not have a quorum, the meeting does not have to be public. Also, but not inclusive, personnel matters, matters of direct confidential public safety, sensitive matters, etc. do not come under the "sunshine law".

Yes. ComSpec and others make them. They run about $55.00 to $75.00.

Let me know if you what me to get one. I can accept a check or m/o.

Just bought one at Ham Radio Outlet. Did'nt even see it advertised anywhere else.

Has anyone else bought one and can share any tips for operation or comments on it's performance.

I think it's great. Tried it side by side with an ICOM R2 and thought the AOR was better in many respects.

I modified an old model which I bought new for $10 and added $7 worth of parts to add low band VHF. I have it in the attic of my garage (about 20 feet up from the ground level)and it does a decent job on the VHF frequencies, especially lo band and air band, compared to the antenna that comes with the scanner. I would say I get about the same results as with a long wire. Hard to tell on UHF since I am near NYC and there are tons of stations regardless of how poor the antenna is. For the price I paid it isn't bad but I would not pay full price for one.

More to the point, is there *any* "blocked" scanner which cannot receive cellular somewhere as an image. Considering that most people live pretty close to at least one cell tower, I would doubt it.

I've owned a DJ-X10 for two years now, waiting for them to do something.
I'm no longer holding my breath!

The programming software and cable for $49.00 sounds like a good deal, since
buying the ICOM/Yaesu cable and modibying it would cost almost as much.

FYI, I asked Optoelectronics about 6 months ago if they were considering
making the SCOUT reaction tune compatible with the DJ-X10. They said they
had it on their plate to do, but there were higher priority things to be
done first.

Message-ID: <MPG.1155a07cf09db6f39896c8@news.earthlink.net>
Source record: 125080

Flat out, there is no comparison. The R2 is built better, has better audio, better sensitivity and is an all around better conceived small scanner. The 16 is AOR's lame attempt to compete in this area. They need to go back to the drawing board, or be a leader and not a follower.

There are two sides of scanning: work and fun.
Computer control eases much of the work and
enhances the fun. Not only that, but a lot of
radio signals now carry data - NOT voice. It
takes a computer to read and decode that data.

4059. Re: Might Florida Law Enforcement Going Digital Violate the Sunshine Law?

Newsgroup: rec.radio.scanner
Date: 1999-03-14 00:00:00 UTC
From: jtward01@aol.com.nospam
Message-ID: <19990314135006.27352.00000439@ng-cb1.aol.com>
Source record: 125085

>From: Piero Sassu <n3fvg@worldlynx.net>
>Date: 03-14-1999 11:39 EST
>

>The "Sunshine Law" specifically deals with public MEETINGS and
>ASSEMBLIES particularly dealing with "taxpayer issues", not public
>safety radio transmissions.

Actually, the so-called "Sunshine Law" is in two parts, one dealing with public meetings and discussion between elected officials and the second with official records. Under the open records provision the tape recordings of public safety radio communications are public records unless they pertain to an ongoing investigation, certain juvenile offenses or sex crimes. Once a person has been charged and the case reaches the discovery phase then the complete recording becomes public record, again except for juvenile offenses or information identifying the victim of a sexual battery. The records of juveniles charged as adults, or charged with certain felonies are also public record.

>Also when dealing with those meetings, as
>long as the politicians involved do not have a quorum, the meeting does
>not have to be public.

This is dead wrong. Any time two or more elected officials meet to discuss official business the meeting must be open to the public and the press and minutes of the meeting must be kept.

> Also, but not inclusive, personnel matters,
>matters of direct confidential public safety, sensitive matters, etc. do
>not come under the "sunshine law".

Depends on what personnel matters you're talking about. The home address and telephone number of a police officer and certain other employees is not public record, nor is their medical record. However, any citizen complaints, disciplinary actions, commendations or other such information, including annual performance reviews, is public record and open to review at any time during normal business hours.

From: John Habbinga <habbinga@wt.net>
Message-ID: <7cerfj$3a$1@news4.wt.net>
Source record: 125125

The discone antenna is a wide band antenna, meaning that it picks up equally as well over a wide range of freuquencies. This makes it an all around good antenna. Also because of its design it is good at receiving aircraft and satellites. The discone antenna has no gain, or 0dB of gain. This means that other antennas will perform better on certain bands. This also means that if your location or scanner is prone to image or intermod interference you will notice more of this problem. Another good thing about the discone is that you can transmit on it with just about any VHF or UHF radio such as a two-meter or 70cm ham radio.

Hope that helps.

On a related note, back in the early 60s most people felt that Russia was
a symbol of less freedoms. What people said would exist in 60s Russia, is
now in the US, the cell phone law being an example. Analog cell phones are
just duplex walkie-talkies linked to a repeaters. The US has made it
illegal to listen to a walkie-talkie. Crazy...

The real test of a calculator is to compute 3^201. The answer should be
7.968419666*10^95. Most calculators do not get the last digits correct.
The last 3 digits of the mantissa should be 666 on a 10 digit calcultator.

hi, i have found an AOR scanner, model
AR2002. it has an output for hooking up
to a computer. i have a couple of questions:
first it is for sale for 215, is that a good
price? second, did the unit come with the
special card at retail or did someone put it
in after the purchase? any idea what the thing
is inside that allows the scanner to output to
a computer? i think i need a propietory cable to
connect to my computer, is this true and if so
how much are they and where do i get them? is it
semi-easy to just get a cheap serial or parallel
cable and change the pin assingments? thanx for
any info!! (ps, to reply directly to me, please
remove the second underscore character from my
address)

They do exist. Look around on the scanner websites. Avoid the Ramsey
inverter kit. It works well, but you cannot adjust the "center frequency"
Different phones use different frequencies and the Ramsey will work on only
a few.

I'm not quite sure why you would want to spend $50 for the
software/interface. You can get Bruce Pope's software for
$10 and build the interface for about $5. If you already have
an Icom or Yeasu interface all you need is a new connector.

You might build a ground-plane antenna. I made one years ago out of coat hangers and a SO-239 connector. I used it for scanning and 2meter amateur. The key is to get it as high as possible. Unfortunately I dont have the instructions any more. It is omni-directional.

Looks like this: (below - side view) you see 2 legs hanging down but you actually have 4. Search around for it. The O is the SO-239 connector. The SO-239 connector is upside down. Each coat hanger wire tip is sanded so the paint is removed and hooked into the holes on each corned of the so-239. The connector (PL-XXX??) that connects the the SO-239 is connected at the bottom with a cable going to your radio (of course the other end of the cable will need a BNC I would assume.

4109. Re: WINTONE question

Newsgroup: rec.radio.scanner
Date: 1999-03-15 00:00:00 UTC
From: rsmerker@steaksandwich.com
Message-ID: <7cjknf$9gb$1@nnrp1.dejanews.com>
Source record: 124964

Wintone decodes tones with your sound card. All you do is select which tone-set you wish to decode, and channel the audio from your sound source (like a scanner) into the Line-in or Mic Jack on your sound card. It then shows you what the tone representation is.

There are several different tone sets available, and you need to make sure to select the correct one for the tones you are hearing. Wintone will not automatically detect which tones are in use (Except with CTCSS).

And there is a MANUAL.RTF in the Wintone Directory, which is the full manual in Rich Text format, viewable in WRITE or MS Word. If you have any specific questions, I suggest emailing support@steaksandwich.com.

Why not just have the Opto unit hooked up to one com port, the 895 to another, and write a program that reads off of the Opto's port and writes to the 895?

If I had an opto counter and appropriate cables I could write it. OR, does anyone have the protocol info on the Opto counters? If so, and you also happen to have the 895 with cable, contact me via email and maybe we can put a quick convertor program together.

Yes, I agree, but incidents like the whole Tom Cruise and Newt Gingrich phone calls are what they use to further their cause. Ever notice how incidents like this get tons of coverage from the cell phone industry while cases where scanner listeners have caught drug dealers red handed are never mentioned?

'nuff said...

Typical John Mackey forge, If you look back John always brings up either Rec.Radio.Swap or the message he forged in my name gay trolling.

How many times you used these John?

What happened was about 5 years ago John as JEMJ was doing his typical false and troubling posts because I complained about his Portland buddy Joe Reeves posting commercial stuff for sale on R.R.S. What was bad is Joe always hid the fact he was a commercial business. He used to do the same on the 80 meter swap net until they banned him. His biggest supporter. John Mackey. Always willing to help a fellow Portlander rip off people.

Not only that John was so mad he came up the I-5 corridor one day and started screaming obscenities and calling me all sorts of things. Pretty funny. I had 3 different hams call me about it. Of course John denies it and says the proof he didn't do it is the repeater op never said anything. Nice try John. N7ZX*, N0MZ* and AB7D* (id hidden from USENET Stalker John)would be more than happy to verify it. Oh wait, they did already John and you called them liars too. The whole world is a liar except John. BAWAHAHAHHA.

Nice try John. You lose again.

: this is so that their communications cannot be monitored by the public. You
: know, the taxpayers who pay their salaries and who have now had to spend untold
: millions for their new Astro and similar digital systems.

I don't agree it's the primary motivation. I think the main reason PD's
go to trunked and/or digital radios is that the old ones aren't meeting
their needs anymore, they need to upgrade their systems. The newer
systems allow more efficient use of available bandwidth and save the
officers the time of having to listen to unnecessary traffic. The fact
that it's more difficult for scanner listeners is just an unfortunate
side-effect. Same thing with the new generation of digital cellphones,
the primary motivation is more efficient use of bandwdith, better
clarity, and more features, privacy is a benefit but not the main reason
they went to digital.

That's because the law prevents these situations. I know, it's
extremely stupid. However, even under the original Radio Secrecy
Section of the Communications Act of 1934, it would have been illegal
to divulge the conversation unless asked to by a court of law.

The CTIA wants "feel good" legislation for their customers. They
don't understand the law of unintended consequences. The more they
prohibit reception, the more they guarantee that somebody is going to
snoop --because they can.

And please understand, it's not that I care one way or the other about
cellular telephony reception. I don't. I care about the precedent
this sets for any future two bit demagog who decides that he doesn't
like what certain foreign broadcasters have to say about this country.

After all, we all know who Joe McCarthy was. It happened before, it
can happen again. Should we leave a loaded gun like the ECPA around
waiting to be used by future despot wannabees?

From: "Darren.D" <dsdavis@yahoo.com>
Message-ID: <36ED7AC5.7814@yahoo.com>
Source record: 124978

I just ordered a Relm HS-200 from Communications Electronics
(www.usascan.com).

Yes, their prices are excellent. The absolute lowest I've seen. But-
watch out.... things aren't quite what they seem.
The prices on the web page don't reflect any shipping costs - and by
that I mean HIS COSTS TO SHIP FROM THE PHILLIPINES! He adds those in
later: It cost me $19 for UPS Ground from Michigan to Boston!! The guy
had a bit of an attitude, too.

So, instead of he $159 advertised price, it's actually $178 shipped.

But, in all fairness, that's STILL much lower than any local or internet
retailer I've seen anywhere. I think Scanner World was second lowest at
$199 plus $8 or $ 10 shipping.

Of course, some places out there still have the thing for $239-$279!!!
So, be very carefull. The price differences for scanners out there are
huge!

-Darren

It's pretty decent, but you can also plug in an external speaker in the back of the unit. My 2 - 2006's are nice and crisp and there's plenty of audio.

I have a DJ-X10 and have also been frustrated by the lack of software. RT Systems of Huntsville, Al has a program for controlling and programing the DJ-X10 which comes with a cable for about $50. I tried it and it worked ok for programing but not very well for computer controlling the radio. I finally sent it back and they credited me with no hassle. They said they were going to try to work ou the bugs I experienced . Maybe by now they have . Their phone # is 800 723 6922. Their program was for windows. Let me know what you find out . Meanwhile, I'm using Bruce Pope's DOS program with a cable from Alinco that works fine.

Usually if you can just get the antenna that is on your scanner outside of your car, then you would get much better reception. You can get the little window mounted extension cables mail order or from RadioShack. This is great if you change cars a lot. The replacement antennas for car stereos work well on VHF (especially the airband) but do poorly on UHF (especially 800 MHz.).

Mint condition AOR8OOO with all factory accessories + Carrying case and
built-in
DS8000 Voice inversion descrambling module. This descrambles the system
used by most cordless phones and many
commercial services. (It does NOT do
anything for digital encryption such as
Cell phones,etc)
Unit covers 500khz to 1.9Ghz with no gaps.It is in as new condition and
also
includes an optional extendable whip.
$425.00 including shipping.

>> it, but again, you never know. As I said before - rumors.
>>
>> Do you know someone at Uniden who can/would verify this? Just curious...

I haven't seen any confirmation by Uniden, but when I asked then, they
said wait six weeks and we should have more information. At least
that's better than blowing off the entire product's existence. The
CEI web site has a section for dealer news and mentions the following:

"Dealers...Now is the time to reserve your Bearcat scanners for
holiday delivery, 1999. Christmas, 1999 is less than 299 days away. By
now, you should have met with your CEI dealer sales representative
regarding placing your dealer orders for the new Uniden scanners for
2nd through 4th quarter 1999 delivery. As always, new products are
allocated only to dealers who have placed advance orders for
immediate shipment and who are not on credit hold. Place your orders
now for the following new models: BC244CLT, BC248CLT, BC278CLT,
BC245XLT, BC780XLT, BC9500XLT, SC180B, SC200."

>published at The Village Voice. Check the article out at
>the URL below...
>
>http://www.villagevoice.com/columns/9908/bunn.shtml
>

A quote from the above referenced article:

"But even if you find a scanner that can listen in on cell phones, that's only part of the problem: the feds are closing in. CTIA's Ayers points to the Wireless Privacy Protection Act currently before Congress, which attempts to make scanner modification illegal, and he promises, "It will sail through." The catch is how the feds will find passive listeners, since they don't leave a trace. Scanner and The Spacew&#65533;rm, on the other hand, are easy targets. As Ayers says, "Scanner will not be hard to find if he's [selling] tickets." "

Further evidence that HR-514 is a useless waste of time and taxpayer money. I can't help but notice the smug confidence of this Ayers character. I'd be pretty damn smug myself if I had the best politicians money could buy....

Let's say for arguments' sake I figure out a way to modify my 895xlt to receive cellular, and I decide to sit and listen in on some fools phone conversation, laugh to myself about it but never mention it to a soul. Technically, this would be a FEDERAL crime, but because there is no disclosure, there is no case. It's like the tree that falls in the woods with no one around. Does it make a sound? Does anyone actually care? Of course not! How is this going to be any different than the legislation we have now? Answer: It isn't.

Just goes to show who really runs this country, doesn't it? Write your congressbeast all you want, he/she knows where their bread is buttered, and that's how these stupid laws get written in the first place.

Actually, a letter writing campaign might work. Tell the dishonest bastards to hold out for more money from the CTIA... ;-)

Geez.... Anyone selling property in Australia? I'm ready to go......

-Phil

I think it`s just morbid curiosity. It`s something new, and everyone has a little voyeur in them. Then (at least for me) the novelty wears off. I was really enjoying it for the first few days I had my scanner, then I got bored. As you said, the public safety frequencies are much more interesting. ("There`s kids there smoking funny stuff" was a line I heard last night. Classic.)

4155. An Open Letter, Apology, and Final Message from CB Rambo

Newsgroup: rec.radio.scanner
Date: 1999-03-16 00:00:00 UTC
From: cbrambo@aol.com
Message-ID: <19990315201608.17299.00001930@ng-fi1.aol.com>
Source record: 124897

Over the past few days, I have spent a great deal of time in reflection of my past behavior on the radio newsgroups. My conclusion is that I have wasted a great deal of time and effort engaging in pointless arguments and petty bickering with other participants here. This is time and effort that would have been much better spent on other, more meaningful pursuits. I have also come to the realization that I have offended some of you with my comments, as some have inadvertently taken my remarks in a personal manner. This was never my intention...and for this, I am truly sorry.

Contrary to popular belief, I am not a "bad guy". If you were to know me in person, you would probably say that I am kind-hearted, free-spirited, fun to be around, and generally easy to get along with. But, like all of us, I also have my character flaws and shortcomings. Specifically, I tend to be particularily stubborn at times (especially when provoked) and I am also prone to "carrying things too far" upon occasion. I like to play games, tease, and joke around...and sometimes, I don't know when to stop. This has always been a weakness of mine, and I am now working very dilligently to control it.

As I read some of my past newsgroup postings, I must admit that I am rather embarrassed and upset with myself for engaging in some of this nonsense. I have made off-topic comments here which have had the effect of causing chaos and disrupting the flow of information for which this forum was designed. I am certainly not the only one who has done this, but that doesn't justify my behavior. Lack of maturity, insecurity, poor judgement, the "thrill" of being safe behind a keyboard, and an occasional feeling of boredom in my life right now...all of these were contributing factors. Again, that does not justify my behavior, but I can see now how these feelings and character flaws caused me to behave as I did. I also tend to get a little "touchy" when someone accuses me or implies that I engage in illegal radio operations. This is simply not true. Never has been, never will be. I am a law-abiding citizen who does not have even as much as a traffic ticket on his police record. I don't mention this as an attempt to justify my behavior, but only so that you might understand why I occasionally acted the way that I did.

In an effort to restore order and tranquility to this newsgroup, I will immediately and forever cease from posting here. I will be available via e-mail for the next 24 hours, and would appreciate hearing from those of you who have thoughts on this matter and do not wish to post them publicly on the newsgroup. When the 24 hours has expired, I will permanently delete the "CB Rambo" screenname from my America Online account and I will not appear online again. I'm sure many of you are skeptical here...and rightfully so...but time will indeed prove my sincerity. Again, I apologize to those whom I offended here and for being a nuisance on this newsgroup.

Thank you for your time. Radio is a wonderful thing. May it have a long and prosperous life. Goodnight and God bless you.

"WHERE'S THAT BIG 'OL CB RAMBO?"
"HE APOLOGIZED, LEFT THE NEWSGROUP, AND WENT AWAY FOR GOOD!"

Hello Michael:

There are several choices in the field today. I would opt for a DSP based decoder. You can buy a used PK-232MBX and upgrade it to a DSP front end. The PK-232 has a signal Identification mode that is very handy for "breaking" non-ham digital communications.

If you are patient, The PK-232/DSP will be available new before Dayton, Check http://www.timewave.com for more data.

Check out http://www.megalink.net/~n1rct/dxcc/vp9story.html for a description of DSP in action.

4160. strange alinco dj-x10 problem sq0_

Newsgroup: rec.radio.scanner
Date: 1999-03-16 00:00:00 UTC
From: pcuni@cris.com
Message-ID: <36edb655.8182420@news.earthlink.net>
Source record: 124902

When I first I got my alinco dj-x10 i must have screwed something up because now most of the preprogrammed memorized channels (MR) are stuck with a mode of SQ0_ instead of NFM or WFM etc. I think somehow I must have accessed a factory mode and was able to screw things up. Anyone? This has the effect of when I scan those channels they are received but no sound is heard. I can reprogram them but there are 100's!

Hmm..... I was just about ready to order one of these but now I think I'll reconsider. The radios quirky operation is bad enough but if the software is buggy then it doesn't seem worth it. I like the idea of a scanner and software in one package but I guess the whole computer controlled scanner thing is still in its infancy. I have percons 99 spectrum and it works pretty well on its own. Any one else have similar problems with sony's SC1PC? Also have you tried reinstalling the software or anything like that?

This text file contains information for restoring coverage of US Cellular Phone
frequencies (and in some cases other information as well) for each of the
following common Radio Shack and Bearcat / Uniden scanners:

Radio Shack

PRO 34
PRO 37
PRO 39
PRO 43 (improved audio)
PRO 46
PRO 2004 (add 100 more channels, s meter, unsquelch light)
PRO 2005
PRO 2006 (keyboard beep delete or attenuate)
PRO 2022
PRO 2026
PRO 2027
PRO 2030

Bearcat / Uniden

BC 200 XLT
BC 205 XLT
BC 760 XLT
BC 855 XLT (add 50 more channels)
BC 950 XLT
BC 2500 XLT

PRO 34

REALISTIC PRO34 MODS & INFO

"NOVICE NOTES" FOR PRO-34 MODIFICATIONS

1. Remove the 4 small phillips scres on the back of the unit

2. Remove the batter cover and battery holder from the case.

3. Remove the two knobs on the top of the case (Volume & Squelch)

4. The Case has some pressure fit points, These are at the bottom of
the case and you need to be a bit careful in forcing the two halves
of the case shell appart. Once you have the pressure fit points
at the bottom released, angle up the bottom of the case until
the battery sepperation wall is clear of the internal metal frame, and
slide towards the top of the unit, place the back half of the shell aside.

5. Now you will see the RF boad mounted to the metal support frame, The
BNC (antenna) conector leads and the volume control power switch leads
are soldered directly to the board. Carefully desolder these 4 connections.

6. At the bottom of the RF board there is a IF Can transformer that has a small
wire as a groundign strap soldered directly to it. Desolder this as well.

7. There will be some wires from the volume controle knob to the PC board that
are socketed. Remove the plug from the ~F board (needle nose pliers work)

8. There will also be a similar wire (small sheilded) from the squelch control
to the RF board wich is also Socketed. Remove the plug from the RF board.
(Again Needle Nose Pliers work good here)

9. Remove the 4 thredded stand-offs from the RF Board (these Hold the RF board
to the internal mettal frame and are where the screws that hold the back of
the case on go.) Use a nut driver or Needle Nose Pliers.

10. Now there the RF board is mostly free. The only thing holding it in is the
row of connector pins on its botom side that plug into the logic board. You
will need to pry this board up gently. Be warned that the bottom side of the
RF board is just chock full of Very Small surface mounted omponents. So use
something non-metalic and smooth to do the prying with.

11. Now that you have removed the RF board, place it along with the case shell
back

12. The Internal Metal support frame is now exposed. there are 3 small phillips
screws holding the mettal frame to the bottom Logic board (actually, these
screws go through the logic board and into the front half of the case.)
2 of the screws are near the top, and 1 is at the bottom of the metal frame.
remove these 3 screws.

13. There is a small socketed wire that leads from the small power pc board on
the metal frame that goes under it and is pluged into the Logic board. Lift
the metal frame up and remove the power plug from the PC board. Place the
metal frame with|the rest of your parts pile.

14. You are have the component side of the Logig board exposed now. There are
2 small phillips screws at the bottom of the PC board (where the Battery
compartment WAS) Remove them.

15. Once you have the the last 2 screw removed the Logic board is free. The speaker wires lead from the speaker to the logic board on the bottom side. These are soldered in but there is enough play in them to allow you to make the mods.

16. NOTE: The keyboard lock switch is a funky little piece of plastic with a sliding stainless metal contactor that is just wedged inbetween the front case and the logic board. Remove both the switch contacts and the plastic switch. (best know it now or loose them in the carpet)

17. On the component side of the PC board you will see lots of nifty surface mounted compone~ts, a fat little barrel capacitor (used for maintaining the channel freqs while you change the batteries.. and make modifications :) near the edge of the PC board you will see a couple of small diodes moutned vertically. These will be labeled on the PC board as D10 and D11, you will also see a place for another diaode to be soldered in but was not installed at the factory.. this is D9.

18. You must now move diode D11 to the place where D9 is labled. As you have probably noticed by now there is a tin cover over about 1/2rd of the PC boards solder side. The edge of the tin cover nearest the diodes has 2 metal tabs soldered to the P board. Desolder these 2 tabs and gently bend the metal cover way from the soder side of the PC board. This will expose the board enough to let you get your soldering iron in to where the diode leads are.

19. Desolder the D11 diode from the bottom while pulling it away from the board on the top of the board using neadle nose pliers on the LEAD only.

20. Now heat up the D9 solder pads and insert the diode (the same way it was oriented in the D11 location)

You Have Completed the Mods for complete 800mhz band coverage and 66-88mhz band coverage.

****

Subject: Eliminating a birdie in the PRO-34 portable scanner
by Bob Parnass, AJ9S

Birdies are unwanted signals generated within a receiver, which cause the receiver to "hear itself." Some birdies are caused by the unwanted product of the local oscillator. Another cause is a stage, which oscillates but isn't meant to oscillate, such as a high gain intermediate frequency (IF) amplifier.

Most birdies, especially those generated by a local oscillator, are frequency stable. It's difficult to rid a radio of these birdies, and solutions usually involve better internal shielding and isolation among the stages.

A "wandering birdie" is one which changes frequency. Wandering birdies, and birdies which appear and disappear suddenly, may be caused by intermittent ground connections within the radio, or defective bypass capacitors.

After using his Radio ShackO PRO-34 portable scanner for a few months, Ron Smithberg, a radio hobbyist in Joliet, was hampered by a "wandering birdie." Ron's scanner was hearing itself on a few frequencies in the VHF-Hi range, but the birdie disappeared when he tilted the radio or squeezed the case. There had been no problem when the scanner was purchased initially.

I suggested that a ground connection or a circuit board in his PRO-34 might be loose. The thin PRO-34 plastic case feels chintzy, and can flex easily by applying just a gentle squeeze. After prolonged use, the case motion can loosen screws which were once tight.

Ron disassembled his PRO-34. He unfastened the helical antenna, knobs, and rear screws, then gingerly removed the plastic case. After Ron tightened a Phillips screw holding the Logic Board to the front of the case, the birdie disappeared forever!

The operation took a steady hand. Although he didn't have to remove any boards, Ron warned that accessing the offending screw was a challenge. He used a very small Phillips screwdriver, positioned through a hole in a shield partition.

****

Restoration of Cellular Frequency Coverage on
Radio Shack PRO-34 Handheld Scanner

1. Remove battery cover and battery, four black screws on rear cover, and volume and squelch knobs.

2. Remove rear cover, lifting back and up to clear controls. Do not remove belt clip or circuit board screws.

3. Unplug the brown volume control connector (grn/yel/blk) and white squelch control connector (wht/blk/red) from the linear circuit board.

4. Unsolder the ground lead from T111 (at corner of linear circuit board above the external power connectors). Unsolder the two power switch leads from the back of the volume control. Unsolder the antenna connector center pin and ground wires from the linear circuit board.

5. Unscrew the four combination screws that hold the linear circuit board and received the back cover screws. Grasp the linear board at the top and lift it straight away from the front case, unplugging the 16-pin connector.

6. Remove the three screws holding the metal frame assembly which held the linear board to the front panel. Unplug the red-black power lead and lay the frame aside. It is still connected to the battery contacts.

7. Locate diodes D9 - D12 on the volume control side of the of the logic circuit board under T1; D10 and D11 are marked. Clip one lead of D11, separating the gap. This may be resoldered later if desired.

8. Reassemble the board by reversing the disassembly procedures above.

pro34.14

Date: 4 Apr 89 14:24:01 GMT
Subject: PRO-34 Scanner Modifications

In the May 1989 edition of Popular Communications is a
"Letter to the Editor" on the Radio Shack PRO-34 Scanner. Below
is the text of that letter.

PRO-34 Scanner Modification

In regard to the information presented (March Issue) on the
handheld Radio Shack PRO-34 scanner, my own observations on the
modifications have been:

1. To restore missing 800 MHz frequencies, remove D-11.

2. To add 66 to 88 MHz (European Coverage), install a diode at
D-9.

3. D-10 must remain in place for full 800 MHz coverage.

4. If a diode is added at D-13 it cuts out aero band, also seems
to affect 800 MHz channel spacing.

5. D-12 added dosen't seem to have any affect.

6. Only D-10 and D-11 are factory installed.

PRO 37

Lines: 143

MODIFICATIONS FOR THE PRO-37

The disassembly instructions are based on the excellent PRO-34 instructions
provided by Chris Scholefield (chriss@mid.com).

First of all, what modifications are possible?

The PRO-37 uses a diode array to tell its microprocessor what model it is, and
thus which frequency bands to allow and what channel spacing to use. European and
Australian models have full 800 MHz cover age (at an unknown channel spacing) and
a VHF-Mid band (68-88 MHz) rather than a VHF-Low band (30-54 MHz).

The Canadian and US models differ in the amount of care taken to reduce EMI. The
Canadian model has additional screening, and one or two other minor component
additions to achieve this. Therefore, if you have the choice, the Canadian model
is preferable to the US model.

VHF-Low to VHF-Mid

Changing from VHF-Low to VHF-Mid band coverage (changing from US / Canadian 30-54 MHx coverage to European 68-88 MHz coverage) requires many component value changes (and realignment of the appropriate RF stage). Given that the PRO-37 uses SMT technology, it's not worth trying. (You can change the diode array easily enough, but just don't expect reasonable performance!)

Restoring Cellular Phone Coverage

The only sensible (straightforward) modification is the restoration of full 800 MHz coverage on Canadian and US models. The ranges restored appear with a 30kHz channel spacing -which just happens to coincide with the N. American cellular telephone channel spacing. A remarkable coincidence. The modification described is therefore applicable ONLY to Canadian and US models. (European and Australian readers could always remove 800 MHz coverage if they wished :-) .

You will need:

Soldering iron -with a fine point.
(The components desoldered and soldered are not SMT, but ....)

Desoldering tool - to remove excess solder

Philips screwdriver - if it fits the screws on the back of the
case it's the right size.
Small pliers -bending component leads while unsoldering and removing
hexagonal posts

Earthing wrist strap - strongly advisable with CMOS components. (Static can
cause premature, if not immediate failure of
components). Wear this at all times.

Small screwdriver -for prying components etc.

Experience and confidence in working with modern electronics

A couple of hours without interruptions ...

Instructions
----
0. READ THROUGH ALL OF THESE INSTRUCTIONS BEFORE STARTING!
1. Remove the battery
2. Remove the antenna
3. Pull to remove squelch and volume knobs
4. Unscrew the 4 screw on the back of the case
5. Separate the case beginning at the battery end and work over the circuit
board and knobs at the top
6. Unsolder both connections to the antenna -ground can be bent away and the
centre has a l ink to the board
7. Unsolder the two power switch links at the board end
8. Unsolder the ground connections to the metal shield
9. Disconnect the two connectors to the squelch and volume controls
10. Remove 4 hexagonal posts

11. The top board may now be removed by separating it gently from the connector on the adjacent board
12. Remove 3 screws holding the shield in place
13. Lift the shield to separate it from the lower control circuit board
14. Identify diodes D12,D13 on the control board
15. EITHER cut the diode D13 and SKIP to reassembly
OR continue to desolder diode
16. Remove last two screws and remove control board. Take care not to dislocate the KEY LOCK switch when doing this.
17. Unsolder screening from side of control board near diode array,
and bend back out of way.
18. Unsolder and remove diode D13. Keep it somewhere so that you can replace it if required to do so by US legislation.

Reassembly is the reverse of the above procedure. If you performed steps 16-18 CHECK REALLY CAREFULLY that the metal part ofthe KEY LOCK switch is in the right location. (Otherwise, you may find yourself having to disassemble the whole thing again - I know, I did!)

NOTES.
1. One must exercise great caution in the procedure. Check that no flakes of solder get dropped on the boards. Take anti-static precautions by doing the work on a mat and wearing a wrist strap. Do not make any adjustments to the upper analogue board or bend any of the other wire links on it, which are tuned circuits.

2. Another caution is that doing any of the work will probably violate any warranty you may have on the scanner. Might be worth burning the scanner in for ~150 hrs before attempting this to reduce the risk of a latent component fault appearing after you have made the modification.

3. YOU PERFORM THE ABOVE PROCEDURE ENTIRELY AT YOUR OWN RISK. You may wish to obtain a copy of the PRO-37 Service Manual from Radio Shack before attempting this. (Cost about $20 - well written - just wish I could afford all the service gear required!)

4. If you happen to find out what adding D14 does (another difference between N. American and European/Australian versions), I'd be interested to know. It's not mentioned in the service manual. I think it could affect 800 MHz channel spacing - any info on the European / Australian PRO-37 specs in this area would be appreciated.

5. If you found something wrong in the above instructions, let me know and I will try and post an update.

6. If you found all this helpful, help someone else and donate $5.00 *today* to your favourite charity. Share and Enjoy!

== PRO-37

This works. I have used this procedure to modify my pro37. One note:there is no reason the remove the logic board. If you have skinny wirecutters, you can easily get to the correct diode. This will save youthe trouble of getting the key pad and key lock back together properly. Restoring the full 800Mhz coverage of the RS Pro-37 scanner. The following notes have been shamelessly plagiarized from Mark Miller'sexcellent instructions on modifying the Pro-34. The two scanners arephysically so similar that I needed to make only a few minor changesin Mark's notes to make them fit the Pro-37.

The instructions below are for those that don't like to completely dissassemble every new electronic toy they buy just to see how it works. Nor is it for the guy that has been building their own equipment since the days of the first tube diode. This set of instructions assumes a moderate level of skill with a soldering iron, and some simple hand tools. It is aimed at those who just want the additional coverage from the mods but havn't been building kits for a decade.

"NOVICE NOTES" FOR PRO-37 MODIFICATIONS

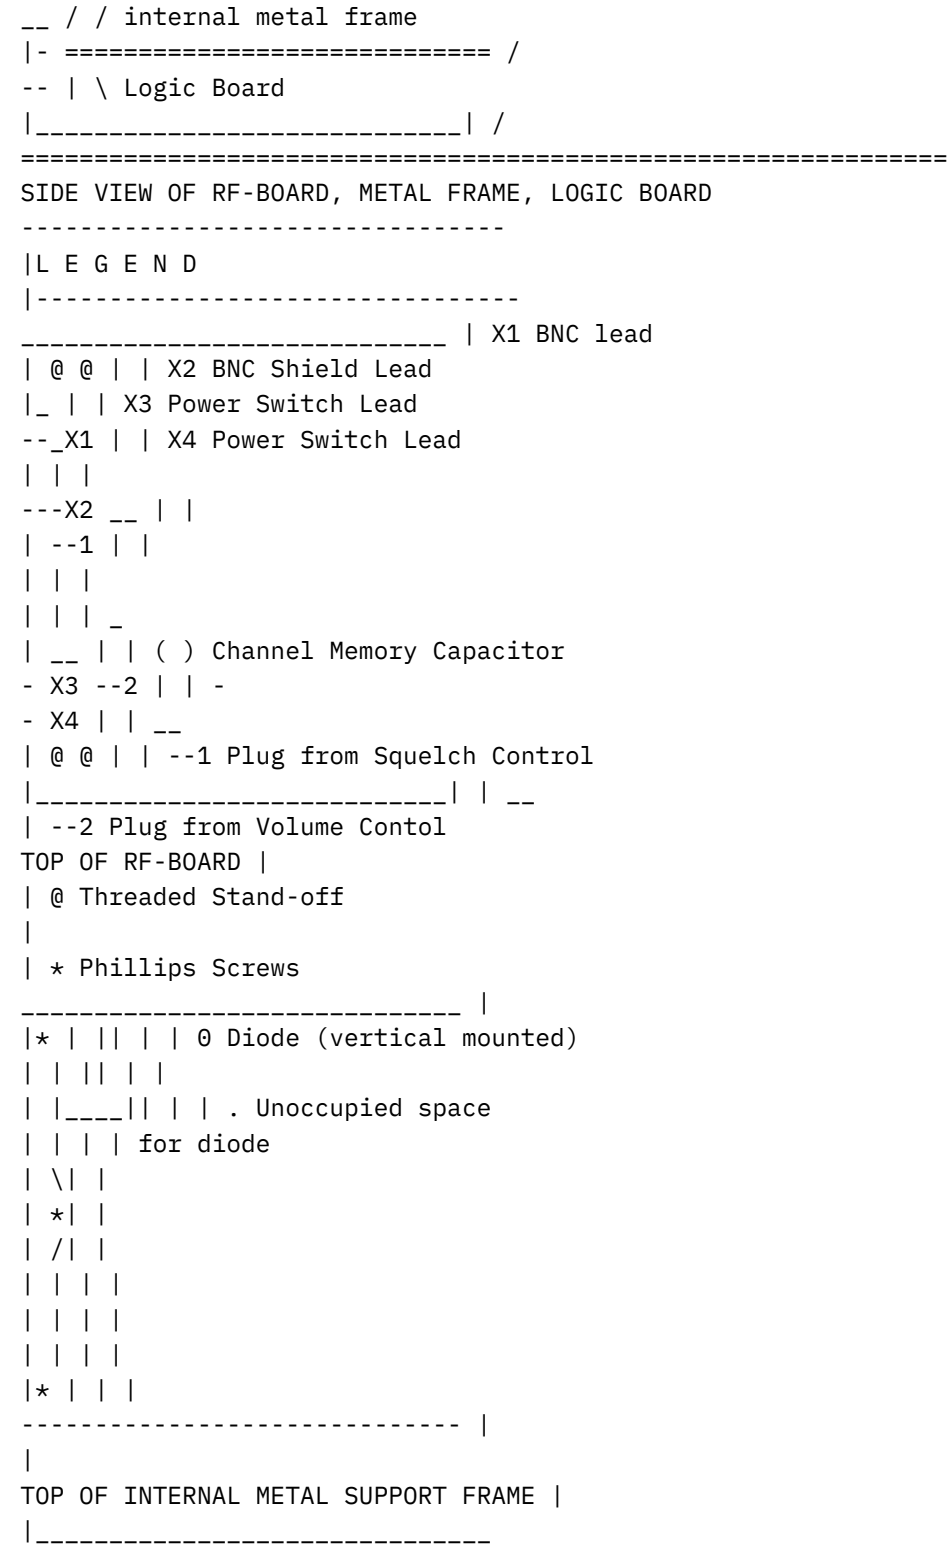
1. Remove the 4 small phillips screws on the back of the unit
2. Remove the battery cover and battery holder from the case. You won't loose your programming as long as you don't take all day to do this.
3. Remove the two knobs on the top of the case (Volume & Squelch)
4. The case snaps together at the bottom via two molded "hooks" in the back half of the case which fit into two indentations in the front half. These can be snapped apart by applying the right leverage to bend the hooks a way from the indentations that they fit into while pulling the case apart. You'll see what I mean when you look at it. You need to be a bit careful in forcing the two halves of the case shell apart. Once you have the snaps at the bottom released, angle up the bottom of the case until the battery separation wall is clear of the internal metal frame, and slide towards the top of the unit. Place the back half of the shell aside.
5. Now you will see the RF board mounted to the metal support frame. The BNC (antenna) conector leads and the volume control power switch leads are soldered directly to the board.
6. Carefully desolder these 4 connections.
7. There will be a wire from the volume control knob to the PC board that is plugged in. Remove the plug from the RF board (needle nose pliers work)
8. There will also be a similar wire (small shielded) from the squelch control to the RF board wich is also plugged in. Remove the plug from the RF board. (Again Needle Nose Pliers work good here)

9. Remove the 4 threaded hex stand-offs from the RF Board (these hold the RF board to the internal metal frame AND are where the screws that hold the back of the case screw in) Use a nut driver or Needle Nose Pliers.
10. Now the RF board is mostly free. The only thing holding it in is the row of connector pins on its botom side that plug into the logic board. You will need to pry this board up gently. Be warned that the bottom side of the RF board is just chock full of Very Small surface mounted components. So use something non-metalic and smooth to do the prying with.
11. Set the RF board aside.
12. The Internal Metal support frame is now exposed. There are 3 small phillips screws holding the metal frame to the bottom Logic board (actually, these screws go through the logic board and into the front half of the case) 2 of the screws are near the top, and 1 is at the bottom of the metal frame. Remove these 3 screws.
13. There is a small socketed wire that leads from the small power pc board on the metal frame that goes under it and is plugged into the Logic board. Lift the metal frame up and remove the power plug from the PC board. Place the metal frame with the rest of your parts pile.
14. You have the component side of the Logic board exposed now. There are 2 small phillips screws at the bottom of the PC board (where the Battery compartment WAS) Remove them.
15. Once you have the the last 2 screws removed the Logic board is free. The speaker wires lead from the speaker to the logic board on the bottom side. These are soldered in but there is enough play in them to allow you to make the mods.
16. NOTE: The keyboard lock switch is a funky little piece of plastic with a sliding stainless metal contactor that is just wedged in between the front case and the logic board. Remove both the switch contacts and the plastic switch. (best know it now or loose them in the carpet)
ALSO: don't touch the innards of the keyboard itself, which will now be exposed. It appears that the keys make direct contact with pads on the circuit board, and you don't want grit and skin oil to be getting in there.

17. On the component side of the PC board you will see lots of nifty surface mounted components, a box-like capacitor (used for maintaining the channel freqs while you change the batteries.. and make modifications :) near the edge of the PC board you will see a couple of small diodes mounted vertically. These will be labeled on the PC board as D12 and D13. You will also see places for two other diodes to be soldered in (labeled D11 and D14) but nothing is installed in these.
18. Now carefully clip the lead coming from D13 and bend the diode away slightly to make a gap between the resulting two pieces of wire. Clip it near the middle to leave plenty of room to resolder, in case you ever want to undo the mod. You have completed the mod for complete 800mhz band coverage.
Follow the same steps backwards (18->1)and replace "remove" with "replace"and "desolder" with "solder" N.B. These instructions are from last night, All the steps are in correct orderas well as the general i nformation. The diagrams are from memory so componentsmay not be in the exact location indicated, but they will be very close.

LASTLY, Now that you have made the mods, you can use the warranty card to light the Bar-B-Q Grill with.

DIAGRAMS



COMPONENT SIDE OF LOGIC BOARD

PRO 39

(from Monitoring Times, January 1993, Dial 1-800-438-8155, Great Magazine!)

Realistic (R) PRO-39 Cellular Restoration (Page 107)

[with a few comments added by someone who witnessed such restoration -jqt]

The recently released PRO-39 handheld scanner from Realistic (R) is a fine performer, but its 800 MHz range is interrupted by the factory censoring of cellular frequency coverage. Long-time MT supporter Larry Wiland of Youngstown, Ohio, would like to share the simple fix. Remember, however, that it is unlawful to listen to cellular phone calls.

(NOTE: These procedures may void your warranty. Do not attempt them unless you are familiar with small component soldering. Monitoring Times accepts no responsibility for damages resulting from attempting this modification.)

TOOLS NEEDED: Fine-tipped soldering iron, desoldering wick, small Philips screwdriver, long-nosed pliers, rosin-core solder.

(1) [Turn off your radio. Removing the batteries when the radio is ON can erase the memory! -jqt] Remove the battery door, holder and [battery pack] from the bottom of the radio.

(2) Remove the four screws from the back of the scanner and carefully lift the back off.

(3) Unplug the two wiring harnesses at their connectors and remove the six bright colored screws [that hold] the circuit board in place. Unsolder the ground wire from the lower right corner of the circuit board. Unsolder the two wire connections from the BNC antenna connector at the board. Carefully lift the board (grasping it near the Molex connector) and set it aside.

(4) Remove the two bright colored screws from the next circuit board. Carefully unplug the two-wire connector [and remove the board, as I recall -jqt]. Unsolder and lift the rectangular metal shield exposing the diodes.

(5) Carefully unsolder and remove diode D6 only; this will restore the missing cellular frequencies which can be searched in appropriate 30 kHz steps.

This completes the cellular restoration. Reverse all procedures to reassemble the radio and test it by entering any frequency between 869-894 MHz. [If you are as lucky as I was, the memory will still contain your other frequencies! -jqt]

Curious about the other diodes? D4 would enable 68-88 MHz coverage, but deletes 30-54 MHz; D5 (present) allows 800 MHz band operation; and D7 would make cellular spacing 12.5 kHz (incorrect).

Thanks Larry!

PRO 43

This file is meant to replace the old PRO-43 mod file.

From: armille@afterlife.ncsc.mil (A. Ray Miller)

Summary: cellular (870-890 MHz) and low band (51-88 MHz) restoration for PRO-43A few people have mentioned the cellular mod for the PRO-43 ; it turns out you should not remove but MOVE the diode. Doing so allows cellular coverage as well as low band (up to 88 MHz) coverage. Acknowledgments to Grove Enterprises; this information came from them. They are selling the PRO-43 for $300 which is $50 less than Radio Shack. I have no connection with them other than as a satisfied customer.

PRO-43 Cellular Frequency Restoration and Low Band Expansion

Note: It is not lawful to monitor cellular or conventional mobile telephone conversations. The following procedure requires familiarity with microcircuit soldering andwill violate your warranty. Grove Enterprises assumes no liability resultingfrom its attempt, nor will accept the modified scanner for return under anycondition.

TOOLS NEEDED: Fine point, low power soldering pencil; solder wick or adesoldering tool; pointed awl, hemostats or pointed tweezers; small Philipsscrewdriver; solder.

1) Remove the battery, antenna and back cover (held in place by four screws).

2) Remove the six screws holding the top circuit board in place. Carefully unsolder the two antenna connections from the board. Bend the antenna groundtab fully up from the board. Carefully lift the board, unplugging the blackconnector at its base, and lay the board out of the way on its bundle of colored wires.

3) Remove the two screws from the next board and lift it, carefully unplugging the white connector at the bottom of the board. Lift it up and lay it aside on its brown wire (which can be unplugged if necessary).

4) Unsolder and remove the metal shield from the final board, revealing the microprocessor; note the row of diodes labeled D1-D5 above it. Only diodes D1, D2, and D4 are present; assisted by a pointed tool, unsolder and remove D4,the lone diode (this restores cellular frequencies which will be searched in 30kHz steps).

5) Resolder the removed diode carefully into position D3 to extend low bandcoverage to 88 MHz. 6) Reassemble the boards, paying particular attention to the alignment of the plugs. Test the radio by entering any frequency between 870 and 890 MHz (cellular) and 51-88 MHz (low band).

From: ross@novax.llnl.gov
Date: 19 Aug 92 16:51:08 GMT

Here is my keypad beep delete mod for the RPO-43:

1. Remove battery.

2. Remove back cover (4 screws).

3. Remove top board (6 screws, desolder two antenna connections and bend antenna ground lead up out of the way). Be careful of black connector at bottom of board. Flip board over and lay aside (wire connectors need not be disconnected).

4. Remove middle board (remove 2 screws and wire connector). Be careful of two multi-pin connectors along underside of board. Set middle board aside.

5. Locate 10 pin connector on side of bottom board (labeled CN3). Note that one end of connector has pin 10 labeled as such. Count back to pin 6 and bend pin 6 ninety degrees towards the large RF shield. Make sure the bent pin clears the RF shield.

6. Reassemble and your done OR do the cell mod since you are so close. Have fun.

Subject: Improved audio for the PRO-43 portable scanner

From: parnass@cbnewse.cb.att.com (Bob Parnass, AJ9S)
Date: Wed, 2 Dec 1992 01:15:35 GMT

IMPROVED AUDIO FOR THE PRO-43 SCANNER by Bob Parnass, AJ9S

The Radio Shack PRO-43 scanner audio is too bassy.

1 The lack of treble makes it difficult to hear the PRO-43 in noisy situations, especially while listening in a car or truck. Louis Shirley sent me a schematic and suggested I remove C341, a tiny 0.015 ufd surface mount capacitor. I'm glad to report that removing C341 made a great improvement. The audio is now much "crisper," more like the Uniden 200xlt, although still not quite as loud. Turning the volume control up still

overloads the PRO-43's small, internal speaker, but there's less need to do that once C341 is removed. The PRO-43 contains 3 printed circuit boards, and the middle (second) board contains the audio circuitry. Finding C341 is difficult, as it is neither marked with a value nor a component designation. It is located on the foil side of the middle board, under IC304, an LM386 amplifier IC. C341 is in parallel with, and physically next to, R350 (33,000 ohm). R350 is slightly larger than C341 and is marked 333. Both R350 and C341 are connected between pin 2 of the LM386 and ground.

A Note About 50-88 MHz Reception Now that I have a schematic, I see that the European version of the PRO-43 has different coils and capaci-tors in the low (mid) band front end filter. That explains why the 75 MHz sensitivity isn't stellar after adding diode D3 to enable 30-88 MHz coverage.

See "PRO-43 Product Review," by Bob Parnass, AJ9S, in the November 1992 RCMA Journal.

Lines: 71

Here is what I found for the Pro-46 mod:
(same from 2 different sources)

Pro46.Mod You will be able to tune continously from 806 to
956 and this will include the appx 870 - 890 cellular band with
the proper 30 MHz steps for the cellular frequencies.

1.Remove battery pack, battery door and antenna.

2.Remove the 4 black screws on the back of the radio: push upward on bottom atrear case and cantliever (swing) case half up from bottom to separ ete andremove, its not necessary to remove belt clip.(note: This sounds much easier than it is. Be prepared to "prop and lever" around 3 catches in the battery case, along with one on each side around 1/4 of the way down the case)

3.Carefully separate RF board from processor board by inserting
eye glass screwdriver between board by plug-in connector.

4.Unsolder copper-coated plastic Rf shield from microprocessor and
set aside. (note: If memory serves me correctly, this SHOULD be the
side where th e pushpad is. In order to follow the rest of the
instructions, place the scanner face down on a piece of cloth or in
a clamp with the antenna facing AWAY from you).

5.Locate two resistors marked "0" (zero) on right side of board.
(note: On mine they were labeled "000", not "0")

6.Carefully unsolder and remove BOTH of the resistors.

7.Reinstall ONE of the removed resistors (or jumper) on the UPPERMOST
set of EMPTY solder pads. (note: These are located just to the
left of where you just removed the two resistors.)

8.Thats it, reassemble the radio.PS-Reintstall one of the removed
zero marked resistors into top set of emptysolder pads. DO NOT
install anything into LOWER SET of empty pads (cancels 30-50 mhz and
adds 68-88 mhz.

****

The Following modification is intended only to restore continuous
806-956 MHz coverage as originally provided by the designof the PRO-
46 Microprocessor.

824-851, 869-896 M Hz Freq Restoration:

Tools Required:

Fine-tipped soldering iron, desoldering wick,small Phillips
screwdriver, small jeweler's type screwdriver,long-nose pliers,
rosin core solder.

(1) Remove the battery pack, battery door and Antenna.

(2) Remove the four black screws from the back of the radio, then push
upward on the bottom of the rear of the case, carefully swinging
it upwards and removing it.

(3) Carefully insert a small (jeweler's) screwdriver between the two
boards next to the interconnect plug in the lower right coner.
Gently pry the top board up to sparate it and set it aside.

(4) Unsolder the copper-coated plastic shield from the microprocessor
and set it aside. CAUTION : Too much heat will damage the shield.

(5) Locate the two chip jumpers imprinted with "0" (on mine they were
imprinted with "000"), near the edge. Carefully unsolder and
remove both. Note: they are side-by-side below the microprocessor.

(6) Solder one chip jumper across the two uppermost unsed solder
pads (Closest to microprocessor). Soldering a jumper across

the lower two pads (futhurest down from microprocessor),
changes the 30-50 Mhz low band to 68-88 Mhz for foreign use.
Don't do this! The RF section is not alligned for 66-88 MHz, and
there's little worth listening to in the US and Canada on that
band, anyway. Note : Unused pads are almost straight across from
where the jumpers where origi nally installed.

(7) Reversse steps 1-4; the modification is now complete.

This DOES work. You should note that the two resistors that you
have to remove are SMALL! The only questions I had wit h this was
what they meant bysolder pads. Well, it turns out that they mean
(duh) the two spots ofsolder that do not hold anything in. And
here I was about to use thesetwo holes near the top of the board!

Anyway, good luck.--Nat Guyton

PRO 2004

The PRO-2004 scanner can be used to receive cellular telephone conversations.
Originally, the scanner was able to receive in this band, but at the last
minute, it was decided to delete cellular coverage from the PRO-2004. The
procedure to re-instate the cellular band is simple for anyone with a pair of
cutters, and a phillips screw-driver.

1. Remove the four screws from the back of the radio, and slide off the cover
from the chassis.

2. Turn the radio upside down. You will find a metal box-like sub-chassis in
the center of the main chassis. Remove the cover andyou will be looking at the
CPU, a 64-pin integrated circuit.

3. Examine the component side of this board, and you will find a row of diodes
and resistors. On one end of the row you will find a diode labeled D-513.

4. Clip the accessible end of D-513, and pry apart the ends so they don't
touch. You have just restored cellular coverage to you scanner.

5. If D-513 is not there, it may be located on the underside ofthe circuit
board.

Information was extracted from POPULAR COMMUNICATIONS Aug 1987.

****

------------------+| Modifications for the 2004 |+------------------------

1. Remove diode from "513" to get excluded 800 MHz freqs.

2. Install a 1N914 diode in "514" to increase scan rate to 10/20 channels-per-
second.

3. Install a 1N914 diode in "510" to get the extra 100 channels.

4. Remove diode from "D-44" to restore missing frequencies in the 806 to 960MHz band.

5. Remove diode from "D-45" to restore coverage from 68 to 88MHz.

In step 5 above, I have no idea what this is for. My 2004 came from the store already scanning this range, and this was the first I had ever heard of it. The same goes for step 4. When I removed D513 (as in step 1), I got those freqs back. Perhaps the user who originally posted these had a radio from a different production run. All I can "vouch" for is steps 1, 2, and 3.

File appended: more mods for the scanner
From: ewb@raybed2.UUCP (EUGENE BALINSKI)
Newsgroups: rec.ham-radio
Subject: PRO-2004 MODS HERE THEY ARE !!!
Keywords: AGAIN !
Date: 12 Jan 89 14:34:39 GMT
Organization: Raytheon Co., Bedford, Mass.

I guess it's time to post this article again. As always do these mods at your own risk. I assume no responsibility. 73 & good listening Gene WA1UXA These mods are detailed in the following articles:

a) POPULAR COMMUNICATIONS AUG 87, PP 18-20
b) MONITORING TIMES OCT 87, P 53
c) MONITORING TIMES DEC 87,P 60

I suggest strongly that you obtain the back issues and read through the letters or articles. I also suggest you subscribe to the mags. They supply a lot ofgreat info and freq lists. Now the mods.

1) Restoring 870 MHz coverage. First treat the radio as if it were CMOS, that is make sure you and it have no built up static charges. UNPLUG THE RADIO FROM THE AC OR DC POWER SOURCE AND ANTENNA !!!!!!!! Take the radio out of the case by removing the 4 screws onthe back. Carefully invert the radio. Locate a box-like sub-circuit. It's near the switch marked "restart". The sub-circuit should be marked PC-3. Carefully pry off the cover of the metal box. Inside there will be a 64 pin dipIC. This is the radio CPU. Be careful not to touch or short out any leads onthe chip. Near the chip there will be a row of diodes marked D-502 to D-515.If D-513 is p resent, cut one lead, separate it so they will not touch, and magic, 870 Mhz is restored. If D-513 is not there and you still do not have 870 coverage, then a little more work is in order. Locate the 9 pin connector "CN-501". Carefully remove it from the sub-circuit. Unscrew the screws holding PC-3 to the main chassis. Carefully invert the sub-circuit board (PC-3). Locate the one lone component on that side of the board. If it is a diode, as it should be, then cut one lead and separate them as above. Re-install thesub-circuit with the screws on to the main chassis. Reconnect the 9 pinconnector.
Do NOT put the cover back on just yet ?!

2&3) 400 CHANNEL and SPEED MOD !

On the top of the sub-circuit board, locate the slot for D-513. Count backwards from there until you get to the space for D-510. Install a diode at D-510 in the same polarity as the rest of the diodes. There, you now have 400 channels instead of 300 ! Now install a diode at D-514 and you have increased the scan speed to 20 channels/sec from 16 ch/sec. Carefully re-assemble the metal box. Make sure everything else is as it should be. RE-invert the radio so it is right side up.

4) THE SQUELCH MOD !!
Now, locate a sub-circuit box under the sloping front panel. It should have many alignment holes in the top. Pry the cover off very carefully. Locate IC-2 in the left side of the pc board. It should be marked IC-10420. Locate R-148, a 47 K ohm resistor between pins 12 and 13. Cut a lead of this resistor, But be sure to leave enough lead on both sides of the cut to solder to. Patch in a 100K ohm resistor. Make sure there are no solder balls or short circuits. Now your squelch will operate more smoothly.

make sure you re-install the metal cover and re-install the radio in the case

I STRONGLY suggest you obtain the above mentioned magazines for more details.

73 Gene WA1UXAPS

Brasstown, NC. 28902

RADIO SHACK 2004 EXPANDED COVERAGE:

1. Remove the 4 philips screws on the back of the unit that hold the case onto the chassis.

2. Slide the radio out of the case by pushing it out the front. Or, put another way, slide the case back, off the radio.

3. Once you've eased the radio out, turn it upside down with the front toward you.

4. Locate a board with "PC-3" stenciled on it in big white letters. It is roughly in the middle of the radio near the back. There is a rectangular, highly reflective (mirror-like) metal cover covering most of this board.

5. Gently remove this metal cover. It is held on by being press-fit over little metal dimples. A little careful prying will do the trick here.

6. Once the cover is off you should see the main CPU chip on the right, a resonator crystal (501-X I think?) in the rear right corner, and a vertical row of diodes to the left of the CPU chip. Some of the diode positions will be lableled like this D-509, D-510, D-511, D-512, *D-513*, etc. I don't remember exactly which ones are labled or not, but that's not so important

right now, you should get the idea.

7. The diode D-513 is labled (I know) and this is the beastie that disables the cellular phone frequencies and their 30KHz search step size. Snip this diode with diagonal cutters (or whatever). Make sure the snipped wire ends are not touching, and viola! You've got full 800MHz coverage on your Pro-2004. 8. You may want to test it at this point. (Try entering 880 MHz or some other previously disabled 800MHz frequency, and verify that you don't get an ERROR.) Re-assemble.

PS: There is a TURBO-Scan mod where you can up the scan speed to around 30ch/s by replacing the resonator crystal in step 6 with a 10MHz version. Also, by soldering in a diode in what would be diode position D-510 (if it were labled) you can add 10 channels to eachbank for a total of 400 ch. The problem with this is that then the keypad's labelling for channel banks becomes incorrect. You should get and verify the complete details on the mods in this "PS" becauseI can't supply you with complete instructions that I am 100% sureabout on these. I'm just letting you know they're possible...

A carrier operated light for the PRO-2004
[repost]
Several PRO-2004 owners have asked for a repost of this article:

A CARRIER OPERATED LIGHT FOR THE PRO-2004 SCANNER by Bob Parnass, AJ9S The July 1988 issue of Monitoring Times suggested that it may be easy to add an S-meter to the Radio ShackO PRO-2004 scanner: "...But adding an "S" meter is even easier than previ-ously thought. Pin 10 on the IF amplifier (IC1) is an "S" meter output. With the proper bridge or meter buffer/amplifier an "S" meter is reality...."

Brace yourself for disappointment - the integrated cir-cuit mentioned in the article is used for WBFM only. Despite the internal IC block diagram in the service manual, pin 10 on my PRO-2004 is useful as an S-meter output only when the radio is in the WBFM mode. Between pin 10 and ground, I placed a 10,000 ohm resistor in series with a 250 microamp meter for a simple test setup. The meter read full scale on strong signals. With no signal at all, the meter read about 70% of full scale. When the mode is set to AM or NBFM, the meter was always at zero. One could add a brie circuit here, but this metering point is of limited utility.

Add a Light Instead With a room full of functioning scanners, it's difficult to determine quickly which radio is "talking." I use separate external speakers on each radio, and the spatial separation helps. In addition to "hearing" which radio is active, I like to "see" which radio is active, and carrier operated lights are effective at providing such visual cues. The idea is to illuminate a lamp when a signal opens the squelch. A small yellow light emitting diode (LED, another Bell Labs invention) is well suited to this purpose. The following modification works well on all PRO-2004 modes. To add a COR light to the PRO-2004, make use of the "scan control" pin (pin 13) on IC2, the TK10420 IC. Pin 13 has voltage present only when a signal is detected. This chip contains the IF, detector, limiter, and squelch circuitry for NBFM. If you tremble with an

electric drill in your hands, read no further. The LED can be mounted in a small hole drilled through the plastic front panel, just to the right of the headphone jack. Electronically, the circuit is simple. The voltage at pin 13 is not enough to drive the LED directly, so a general purpose NPN transistor (e.g., a 2N2222) can be used as a solid state switch.

- Pin 13 of IC2 is connected to the transistor base through a 10,000 ohm resistor.

- The emitter is grounded.

- The collector is connected through a 1000 ohm resistor to one end of an LED. This resistor limits the LED current to about 13 milliamps.

- The other end of the LED is connected to one contact on the rear of the PRO-2004's on/off, volume control. This furnishes about 14 VDC unregulated

here a list of the diode functions as printed in
Aug 1988 edition of 73 by KB6LCN

d-510 in circut - scanner will have 400 memories (10 x 40)
not in circut - scanner will have 300 memories (10 x 30)

d-512 in circuit - it will step 30 kHz from 825-844.995 and 870-889.995
removed - " " " 12.5 " " " " "a

d-513 in circut - will not scan 825-844.995 MHz or 870-889.995 MHz
removed - will scan all of 800 MHz band

d-514 in circuit - scanning rate increases to 20 channels per second
not in circut - scanning rate in 19 ch/sec (alt 8 ch/sec)

!!!! WATCH POLARITY !!!!

in Aug 1987 Popular Communications Bill Cheek gives the bet details to bring back the lost 800 MHz Freqs. and poinsts out that in the replaced bands the defalt skip rate for a search is 30 MHz however if change it with the step key you need to press the RESET key on the front keypad to return to 30 MHz increment step. (RESET is to to be confused with the RESTART button on the rear of the unit).

he also gives modifications for an S-meter

S-METER

1 - locate transister q-9 (far frount right area of the radio, just under the sloaping front panel.

2 - drill a 1/4" hole in the rear chassis of the radio

3 - install a RCA jack in this hole

4 - Install on lead of a .10-uF ceramic disc capacitor to the center lug of the RCA jack and the other lead to ground lug of the RCA jack

5 - clip off all but 1/4" of leads of a 10-K ohm resistor. Carefully,
soder one lead to the collector (center lead) of q-9.
!!! pretin all leads and use a low watt iron with sharp tip

6 - solder a 12" wire to the free end of the 10-K resistor. Slip a 1"
section of insulated tubing over resistor and wire to prevent
shorting.

7 - connect free end of the wire to the center lug of the RCA jack

8 - connect a voltmeter capable of reading between 1 and 3 volts,
DC (digital or analog to a RCA plug. red wire to center, and
black wire to the shell. shielding in not needed.

connecting the rca jack and plug will now give you a measurement
of the recievers intermediate frequency automatic gain control (IF AGC)
the auther said the the range will be between + 1.87 volts DC with
no signals present to +2.6 volts DC for a strong signal. he also
suggested that a digital voltmeter with 2 or three decimal places
gave better resolution.

If any else knows mods let us know.

by Gene WA1UXA

In response to numerous inquiries I am posting a short overview of the
mods to the Radio Shack PRO-2004 scanner. First, all mods are done at
your own risk. I assume no responsibility. I do not know what effect they
(the mods) will have on any warranty, however I would think they would
probably void it. Also, one of the mods restores coverage of the cellular
phone frequencies. It is ILLEGAL TO LISTEN TO CONVERSATIONS IN THIS BAND !
^^
Therefore my supplying info to you does NOT in any way constitute an invitation
to break the law. You are on your own!

These mods are detailed in the following articles:
a) POPULAR COMMUNICATIONS AUG 87, PP 18-20
b) MONITORING TIMES OCT 87, P 53
c) MONITORING TIMES DEC 87,P 60
I suggest strongly that you obtain the back issues and read through the letters
or articles. I also suggest you subscribe to the mags. They supply a lot of great
info and freq lists. Now the mods.

1) Restoring 870 MHz coverage.
First treat the radio as if it were CMOS, that is make sure you and it have no
built up static charges. UNPLUG THE RADIO FROM THE AC OR DC POWER SOURCE AND
ANTENNA !!!!!!!! Take the radio out of the case by removing the 4 screws on
the back. Carefully invert the radio. Locate a box-like sub-circuit. It's
near the switch marked "restart". The sub-circuit should be marked PC-3.
Carefully pry off the cover of the metal box. Inside there will be a 64 pin dip
IC. This is the radio CPU. Be careful not to touch or short out any leads on the
chip. Near the chip there will be a row of diodes marked D-502 to D-515. If D-
513 is present, cut one lead, separate it so they will not touch, and magic, 870
Mhz is restored. If D-513 is not there and you still do not have

870 coverage, then a little more work is in order. Locate the 9 pin connector "CN-501". Carefully remove it from the sub-circuit. Unscrew the screws holding PC-3 to the main chassis. Carefully invert the sub-circuit board (PC-3). Locate the one lone component on that side of the board. If it is a diode, as it should be, then cut one lead and separate them as above. Re-install the sub-circuit with the screws on to the main chassis. Reconnect the 9 pin connector. Do NOT put the cover back on just yet ?!

2&3) 400 CHANNEL and SPEED MOD !
On the top of the sub-circuit board, locate the slot for D-513. Count backwards from there until you get to the space for D-510. Install a diode at D-510 in the same polarity as the rest of the diodes. There, you now have 400 channels instead of 300 ! Now install a diode at D-514 and you have increased the scan speed to 20 channels/sec from 16 ch/sec. Carefully re-assemble the metal box. Make sure everything else is as it should be. RE-invert the radio so it is right side up.

4) THE SQUELCH MOD !!
Now, locate a sub-circuit box under the sloping front panel. It should have many alignment holes in the top. Pry the cover off very carefully. Locate IC-2 in the left side of the pc board. It should be marked IC-10420. Locate R-148, a 47 K ohm resistor between pins 12 and 13. Cut a lead of this resistor, But be sure to leave enough lead on both sides of the cut to solder to. Patch in a 100K ohm resistor. Make sure there are no solder balls or short circuits. Now your squelch will operate more smoothly.

Again, I STRONGLY suggest you obtain the above mentioned magazines for more details. Addresses appear below. Please ignore any mis-spellings, mis grammer, etc. Good luck and good listening !!!

PS, make sure you re-install the metal cover and re-install the radio in the case !!!!!!!!!!!!!!!!

PRO 2004 Cellular Restoration Mod (Novice Instructions):

1. Remove the 4 philips screws on the back of the unit that hold the case onto the chassis.

2. Slide the radio out of the case by pushing it out the front. Or, put another way, slide the case back, off the radio.

3. Once you've eased the radio out, turn it upside down with the front toward you.

4. Locate a board with "PC-3" stenciled on it in big white letters.
It is roughly in the middle of the radio near the back.
There is a rectangular, highly reflective (mirror-like) metal
cover covering most of this board.

5. Gently remove this metal cover. It is held on by being press-fit
over little metal dimples. A little careful prying will do the
trick here.

6. Once the cover is off you should see the main CPU chip on the
right, a resonator crystal (501-X I think?) in the rear right
corner, and a vertical row of diodes to the left of the CPU chip.
Some of diode positions will be lableled like this D-509, D-510,
D-511, D-512, *D-513*, etc. I don't remember exactly which ones
are labled or not, but that's not so important right now, you
should get the idea.

7. The diode D-513 is labled (I know) and this is the beastie that
disables the cellular phone frequencies and their 30KHz search
step size. Snip this diode with diagonal cutters (or whatever).
Make sure the snipped wire ends are not touching, and viola!
You've got full 800MHz coverage on your Pro-2004.

8. You may want to test it at this point. (Try entering 880 MHz or
some other previously disabled 800MHz frequency, and verify that
you don't get an ERROR.) Re-assemble.

PS: There is a TURBO-Scan mod where you can up the scan speed to
around 30ch/s by replacing the resonator crystal in step 6 with a
10MHz version. Also, by soldering in a diode in what would be diode
position D-510 (if it were labled) you can add 10 channels to each
bank for a total of 400 ch. The problem with this is that then the
keypad's labelling for channel banks becomes incorrect. You should
get and verify the complete details on the mods in this "PS" because
I can't supply you with complete instructions that I am 100% sure
about on these. I'm just letting you know they're possible...

] Turbo scan for the 2004 ??? Yes !! Someone has realized that if you
] replace the present 7.37 MHz ceramic resonator CX501, with a 10.7 MHz
] ceramic resonator it really boosts the scan/search speed! The present
] resonator is soldered between pins 29 and 30 of the CPU (IC-503).
] Rumor has it that a 10.00 MHz computer xtal will work just fine.
] Note: The effect of the speed mod on weak signal performance is
] presently unknown.

The resonator is for the CPU clock oscillator. Jacque KA9FJS confirms
that the mod works with an ordinary 10 MHz computer crystal ($1 at
hamfest) but reports a possibly-undesirable side effect: Increasing
the clock rate _decreases_ the resume-scan delay time. Jacque says:
"The manual says delay is 2 seconds; with mod, delay is <1 second.
Painful if a channel is filled with slow responders." He reports no
detection problems at the increased scan rate.

>Also, by soldering a diode in... position D-510 (if it were labled)
>you can add 10 channels to each bank for a total of 400 ch. The
>problem with this is that then the keypad's labelling for channel
>banks becomes incorrect...

PRO 2005

PRO 2005 Mods

Date: 30 Jan 90 10:22:00 GMT
Subject: 2004/2005 modifications

>Can someone please post the mods for the PRO-2004 & PRO-2005 for continuous
coverage through the 800 Mhz band, increased scan speed, etc. I know someone who
is interested in buying a PRO-2004/2005 and would like more info on these mods.
Mon 01-29-1990 [07:38] "Someone who is interested"??? Heh heh heh. Yeah, I
don't listen to the CMT band, either. That ECPA has got me just _petrified_, hi.
:-)I got these off a bulletin board.

---------------+| Modifications for the 2005 |+---------------

There is a socket that is not marked so it will be referred to as D501.

D501 and D503 removed: Scan rate of 6/12 cps
D501 only installed : Scan rate of 7/14 cps
*D503 only installed: Scan rate of 8/16 cps
D501 and D503 installed: Scan rate of 10/20 cps (horray!)
*D502 installed : Disable 823.95-850.95 MHz and 868.95-895.95 MHz
D502 removed: Full coverage from 760-1300 MHz
D504 installed: Normal spacing for all bands.
*D504 removed: Enable 30 kHz spacing in areas restored by D502 removal

* = Stock US model configuration

PRO-2006 Modifications

NOTE: The Electronic Communications Privacy Act of 1986 makes it unlawful to monitor mobile telephones, including cellular. The following modification is intended only to restore continuous 760-1300 MHzcoverage as originally provided by the design of the PRO-2006 microprocessor. BE SURE TO TEST YOUR PRO-2006 FULLY BEFORE ATTEMPTING THISMODIFICATION. ANY MODIFICATION MAY VOID YOUR WARRENTY.

824-851, 869-896 MHz Frequency Restoration:

Tools Required: small Phillips screwdriver, small wire cutters.

Procedure: With the power cord unplugged, remove the two rear cabinet screws holding the upper cover. Lift off the upper cover, being careful not to stretch the speaker leads. Examine the inner, right-hand-corner of the front panel to find two glass diodes, labelled D503 (upper diode) and D502 (lower diode). Using the clippers, very carefully snip the visible lead of the lowerdiode (D502) at its bend and slightly separate the cut ends. If it is ever necessary to send the radio back for warrenty repair, the diode leads should be carefully resoldered. Reassemble, plug in AC cord, turn on scanner, and press RESET.

Keyboard Beep Delete:

With the top cover removed as described above, locate connector CN3, a 15-pin connector with colored wires at the front of the main circuit board. There are two precedures which w ill stop the beep tone from being heard through the speaker; read both to decide which procedure you want to follow.

(1) Find the center grey wire coming from CN3 and cut it midway to disable the beep tone. You may wish to solder a resistor in series to reduce the beep volume, a trimpot to vary the volume of the beeptone, or a minature switch to choose between beep and no beep.

(or)

(2) Using a pair of needle-nose pliers, CAREFULLY pry the plug from CN3,revealing a row of pins. Locate the center pin (#8) which corresponds to the grey wire and bend it down flat, disabling the beep circuit. Reinsert the plug. The pin may be erected again later to restore the beep tone if desired. This completes the restoration procedure. Reattach the cover and
replacethe screws.

Grove Enterprises, P.O. Box 98, 140 Dogbranch Road
Brasstown, NC; 1-704-837-9200

==========

PRO2022

Cellular Restoration on the Realistic PRO-2022

The Realistic PRO-2022 certainly is a look-alike for the all-time popular, but now-discontinued, PRO-2005. But is the similarity only cosmetic? What tricks can be done to increase the utility of the lower-cost 2022, now availible from Radio Shack and Grove Enterprises? Of the greatest interest, can cellular phone coverage, censored at the factory, be restored? Yes.

After removing the two upper back screws and the top lid, locate the black cable just behind the front panel. Adjacent to the cable are four diodes locations: D42, D43, D44 and D45.

D42 is not present; installed, it adds the 68-88 MHz European mid band (which includes the US 76-82 MHz mid band), removing the US 30-54 MHz low band. Even if a switch were installed to allow the diode to be selected, additional components and realignment are necessary for that higher frequency coverage. Don't do it!

D43 is present, allowing the 800 MHz band to be received; the diode may be deleted so that the same microprocessor may be used in scanner modles which don't have that 800 MHz capability. Don't touch it!

D44 is present, deleting the cellular mobile and base frequencies. If one lead is cut, total 806-960 frequency is restored, including 30 kHz steps in the cellular band. Keep in mind, however, that mobile telephone eavesdropping is prohibited by the Electronic Communications Privacy Act!

This modification may void your warrenty; it is best to cut the lead carefully, gently separating the gap slightly so that it may be resoldered in case the radio needs warrenty repair later.

D45 is not present; installed, it makes the cellular 30 kHz increments change to 12.5 kHz. A small SPST switch connected in series with one lead of a 1N914 or 1N4148 could allow selection of the 25 kHz step interval in those areas which utilize that channel spacing.

To do this, it is necessary to unsolder a shield under the circuit board which covers the solder pads for the diodes. Such a modification should only be attempted by someone familiar with electronic circuitry.

PRO 2026 800 MHz cellular restoration

From: steuer@clam.rutgers.edu (robert Steuer)
Newsgroups: alt.radio.scanner
Subject: PRO-2026 MODS!!!
Message-ID: <Oct.20.10.55.49.1992.11077@clam.rutgers.edu>
Date: 20 Oct 92 14:55:50 GMT
Organization: Rutgers Univ., New Brunswick, N.J.
Lines: 29

Hi all, just got these mods, hot off the FAX! Note: It is not lawful to monitor cellular or conventional mobile telephone conversations. The 2026 has cellular frequencies deleted at the factory, but restoration is the easiest ever! - clip one marked wire! All you needis a Philips screwdriver and wire cutters.

1. Turn the scanner upside-down and remove the four side screws holding the bottom cover in place; pull the cover loose and set it back about two inches out of the way.

2. Locate the small circuit board at the lower right-hand corner andfind jumper L201. Cut it and slightly separate the break.3. Reassemble the radio which now has continuous 806-956 MHz coverage and 30KHz search increments in the cellular band.

*** I have not tried the above mod, but did acquire it from acommercial radio dealer who is very respectable, so as always, proceedat your own risk and realize that this will violate your warranty! Have Fun! Rob KF2EK---

PRO2027

RESTORATION OF CELLULAR FREQUENCIES FOR RADIO SHACK PRO-2027

For those that are interested, the following modification will enable uninterrupted reception of the 806MHz - 960Mhz spectrum. This modification may be useful to those who use a scanner in conjunction with down converters for satellite monitoring. Channel step size in the cellular band is increased to 30KHz. PLEASE BE ADVISED THAT IT IS ILLEGAL TO MONITOR CELLULAR TELEPHONE CONVERSATIONS. Not only is it illegal but unethical.

With the advertisements out of the way here's how its done.

1. Unplug unit. (Obvious but I must say it.)

2. Remove bottom panel (4 screws)

3. Locate diode D35 located behind the enter key. This is a surface mounted component that resembles a tiny black square.

4. Unsolder D35. I prefer to unsolder one leg so that the original functionality can be restored for resale. This can be done by gently prying up the component with a pin or tweezers while touching one leg with a soldering iron. Don't apply too much heat a 15 - 20 watt soldering iron is more than adequate.

5. Button it up and turn it on. No reset is needed.

PRO2030

PRO2030 Mod

From: Jeff Goldman, 76703,4224
To: Roy Brown WB0MFV, 75225,1406
Topic: Pro 2030 restore
Msg #200480, reply to #200474
Section: VHF/UHF Scanning [2]
Forum: HamNet <Ham Radio>
Date: Fri, Aug 27, 1993, 6:49:19 PM

It's a wonderful scanner there, Roy. I bought it (used the 10% Off New Items coupon in the new catalog) and modified it.
The mod takes about 2 seconds. :-) I'm in a high RF area, so intermod was pretty bad. I swapped the tiny Pro2030 with a friend's BC890XLT that has a PL board. (I'd sold him my BC890XLT about a month ago to make room for the upcoming BC8500XLT, but decided against the 8500 in the end. <g>)

Anyways, take out the screws so you can open up the 2030. Looking down into the top of the scanner right behind the
front panel you'll notice a little metal loop that's labeled L201. CLIP that jumper and move the two pieces a little away from each other. The loop's so small and rigid that if you
ever need service, you could bend the to parts together and nobody would know you snipped them.

-Jeff

BC 200 XLT
BC 205 XLT

UNIDEN/BEARCAT 200/205XLT TEST MODE

by Bob Parnass, AJ9S

According to the Uniden/Bearcat 200/205XLT Service Information Manual, the following procedure will load channels 1-25 with various test frequencies, and zero the remaining 175 channels:

1. Press and hold three keys: 2, 9, and MAN simul-taneously and turn the power switch on.

2. Set the power switch to the off position.

3. Repress and again hold three keys: 2, 9, and SCAN simultaneously and turn the power switch on.

BC200/205XLT CELLULAR RESTORATION

Note: It is unlawful to monitor cellular telephone conversations. It is possible to monitor signals from the deleted ranges even without conversion. Simply add 21.7 MHz to the deleted frequency and enter the higher (image) frequency. Reception is virtually identical in strength to that which would be heard on the deleted frequency.

The frequencies deleted at the factory may be restored, but the procedure must not be attempted by anyone unfamiliar with electronic circuitry. Grove Enterprises assumes no liability for damage caused by this procedure. (I won't eighter! WA2ISE). The modification will void
your warranty.

TOOLS REQUIRED: Small Phillips screwdriver, small wire cutters.

1. Slide off the battery pack and remove the antenna from the scanner.
2. Using a small Phillips screwdriver, remove the two screws from the back of the scanner, the two screws which hold the battery retaining spring at the base and the spring itself.
3. Carefully pry the bottom of the rear cover from the radio and remove the cover.
4. Locate the two small screws at the base of the circuit board and remove them. Gently pull the front panel from the mainframe at the base and separate them.
5. Locate the (64 pin quad flatpack) microprocessor IC labelled "UNIDEN UC-1147" and the 10k ohm (brown-black-orange) leadless resistor positioned above the letters "DEN" on the IC.
6. Using miniature wire cutters, cut the resistor body in two without disturbing anything else near it. If the left solder pad comes loose, it may be peeled from the board. Brush or blow away any residue. This completes the restoration.

REASSEMBLY

7. Insert the top of the front panel into the slot under the volume/squelch control panel and, noting carefully the alignment of the dual inline connector at the bottom of the board with the mating socket, press the front panel firmly into place. Be sure that the holes at the bottom of the circuit board line up with the holes in the plastic standoffs below them. Insert the two screws and gently tighten them.

8. Replace the back cover by inserting the top of the cover into the slot under the volume/squelch control panel; press the cover into place, insert and tighten the screws.

9. Reposition the battery retaining spring (slotted side toward notched hole), insert the two remaining screws and gently but securely tighten them.

10. Slide the battery pack into place; switch the scanner on to make sure
the display comes on. If not, the battery is discharged or the dual-
inline connector was misaligned during assembly
(see step 7).
Assuming the display comes on, press: MANUAL, 845.0, E; within two
seconds, the frequency 845.000 should appear on the display.
Cut this resistor

BEARCAT BC200/205XLT SCANNER MODIFICATION

RESTORING THE DELETED 800MHZ BAND OF YOUR BC200/205XLT CAN BE
ACCOMPLISHED EASILY BY LOCATING THE MICROPROCESSOR LABELED,"UNIDEN UC-
1147". ONCE YOU'VE IDENTIFIED THAT IC,LOCATE THE 10K OHM RESISTOR (BROWN-BLACK-
ORANGE) POSITIONED ABOVE THE LETTERS "DEN" ON THE IC. THE RESISTOR IS LEADLESS,SO
TO ACCOMPLISH THE MOD,SIMPLY CUT THE BODY OF
THE RESISTOR IN HALF. USE MINIATURE WIRE CUTTERS.

DO NOT DISTURB ANYTHING NEAR IT. IF THE LEFT SOLDER PAD COMES LOOSE,IT
MAY BE PEELED FROM THE BOARD. BRUSH OR BLOW AWAY ANY RESIDUE.

NOTE*** IT IS UNLAWFUL TO MONITOR CELLULAR TELEPHONE CONVERSATIONS

73 DENNIS WB2WPO @ KE2KQ HUNTINGTON NY (ZIP 11743BC200XLT.6

ALL USERS OF THE BEARCAT 200-XLT HANDHELD SCANNER HAVE PROBABLY HAD
PROBLEMS CONCERNING SHORT BATTERY PACK LIFE. BATTERY INDICATOR COMES
ON TOO SOON. AFTER TINKERING AROUND WITH THE RIG, A SIMPLE SOLUTION
HAS BEEN FOUND. THIS MOD WILL VOID YOUR WARRANTY AND YOU DO THIS AT
YOUR OWN RISK. [I HAD NO PROBLEMS WHATSOEVER.]

1. SLIDE OFF BATTERY PACK.
2. REMOVE TWO SCREWS ON BACK OF RIG.

3. REMOVE TWO SCREWS ON BOTTOM OF RIG THAT HOLD CLIP IN PLACE.
4. CAREFULLY REMOVE BACK OF SCANNER.
5. REMOVE TWO SCREWS AT BOTTOM OF BOARD NEAR RED CONTACT WIRE. L+R
6. SEPERATE THE TWO BOARDS VERY CAREFULLY. CONNECTED BY 16 PIN DIP SOCKET. 7. BOARD IS PH-069AA OR PH-O69AC. POSITION BOARD WITH DIP SOCKET AT LOWER RIGHT HAND SIDE.
8. AT LOWER LEFT OF BOARD, NOTICE TWO ELECTROLYTIC CAPS. C-214 C216.
9. D-203 IS LOCATED JUST ABOVE THESE TWO CAPS. IT IS A GLASS TYPE ZENER DIODE WITH COLORED BANDS FOR MARKINGS.
10. WITH A SMALL, FINE PIECE OF WIRE SOLDER ACROSS DIODE D-203.
11. THAT'S IT!!!!!! NOW THE BATTERY INDICATOR WILL NOT COME ON AND YOU WILL NOT BE BOTHERED BY TURNING OFF AND ON THE RIG TO RESET THE TIMER. [THUS ENABLING YOU TO USE THE NICAD PACK TO IT'S FULLEST EXTENT.] DISPLAY BLANKS OUT AT ABOUT 4.5 VOLTS.
12. RE-ASSEMBLE RIG IN REVERSE ORDER AND YOUR IN BACK IN BUSINESS.

MARK N8JCF @ WA8OOH

BC 760 XLT
BC 950 XLT

Bearcat BC 760 XLT mods

BC760XLT
Concerning the Uniden Bearcat 760xlt, the mod for the 950xlt does work to restore lost freq. Disconnect pin 20 of the microprocessor from the circuit board and connect it to pin 19. I bent the pin slightly and cut it with the scissors of a swiss army knife then soldered an 1/8 lead cut from a cap across the pins near the top of the chip. I've yet to find any problem with this mod. But as always do so at your own risk.

****

THE FOLLOWING "MAGICAL" MODIFICATION WILL ALLOW RECEPTION OF CELLUAR PHONE BAND ON A BEARCAT 760XLT. NOTE- THIS MODIFICATION SHOULD BE PERFORMED BY SOMEONE VERY FAMILIAR WITH ELECTRONIC COMPONETS. THIS WILL ALSO VOID YOUR WARRANTY. AUTHOR ASSUMES NO RESPONSIBILITY WHATSOEVER.

1- Disconnect power cord from wall outlet, remove the four screws holding the bottom cover on. Remove bottom cover carefully, speaker wires are attached.

2- Locate the large 64 pin microprocessor chip near front of the radio. Noting the indented dot which marks pin one, count along row to pin 20. Cut that pin close to the circuit board so if you ever want you could tack solder it back together.

Chip im my unit has following numbers:
7D3
HD 40740085
JAPAN

3- Temporarily reconnect power to the radio and attempt to program 845.000 Mhz., confirming cellur band restoration. Frequencies may be entered in 12.5 Khz, not 30 Khz, increments.

4- This completes the magical instructions, disconnect power, reassemble scanner in reverse order. Rember performing this magic voids your warranty, not to mention the fact it is illegal and if the King's "henchmen" catch you, you mab be severely fined or maby even thrown into dungeon.

BC 2500 XLT

NOTE: since receiving this mod, I have been told that there are two different pc board designs for the 2500xlt. Make sure you have the unit that corresponds to this mod.

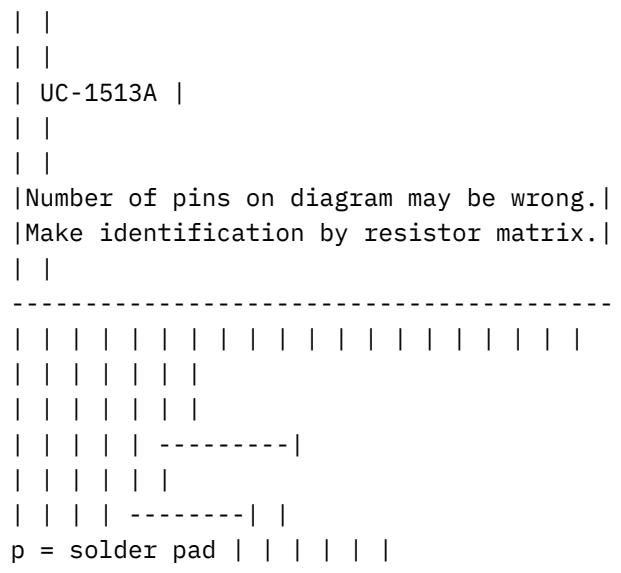
This is the cellular restoration mod for the Bearcat 2500xlt.
The diagrams included make things much easier to understand.

1. Remove the antenna and battery pack from the BC2500XLT. Lay it on its face on a soft cloth or towel, bottom of the radio facing you. Remove the two upper (black) and two lower (chrome) screws.

2. Carefully pry the back loose from the radio and lift it off. Similarly, grasp the visible circuit board by the edges and carefully pull it away fron the radio just far enough to separate it from the white (11 pin) Molex connector. Do not stretch the remaining ribbon connector. Lay the board alongside the radio.

3. Locate microprocessor chip "Uniden UC-1513A", and the cluster of chip resistors marked "104" below it (see diagram). Using a magnifier and fine-point soldering iron, unsolder the lower-left-most chip resistor and move it one place to the left, soldering it in place.

Reassemble the radio by reversing steps 1 and 2, and test it by entering 879.990Mhz. Search steps in this range will be the correct 30 KHz.



```
c = a component | | | --------| | -----
R = the resistor to move | | | ---- | | \
X = the new location | | | / \ | | \
for "104" p | p-c-p p | p-c-p |
/ | / / / | | |

BC 855 XLT

Here is a repost of John Wilkerson's article from Feb 1993
on modifying the Uniden 855XLT:
```

UNIDEN BC-855XLT MODIFICATIONS
Scope of modifications:
[1] Allow continuous 800 MHz receive.
[2] Increase channel capacity from 50 to 100 ch.

```
1 2 3 4
:-----------------------------------------:
| I p p p p o o o o o o o |
:----------| I | | | | |
| [I] | | X X <-- CUT |
| [I] D201 | | | | |
| [I] oooooo | | | | |
| I d d d d |
| I------/\/\/\--------|--| |
| |
| ADD 4.7K - 22K Ohm (10K works) |
| 1/4 watt carbon resistor between |
| diode D201 and lower connection |
| of Jumpers 3 & 4 |
| Jumper 3 - 100 ch. Jumper 4 - 800 MHz |
|-------------------------------------------------|
```

1. Remove 5 screws from bottom of scanner case.
2. Carefully separate case top and bottom.
3. Unplug connector to the internal speaker.
4. Locate diode D201 and 4 jumpers near edge of circuit board.
5. Cut the 3rd and 4th jumpers near the middle and fold
downwulate leads, if necessary.

6. Connect the lower part of jumper 3 & 4 to one end of a 10K
Ohm 1/4 watt carbon resistor, insulate all exposed leads.
7. Connect the other resistor lead to the lower connection of
diode D201, DO NOT cut any leads on D201.
8. Make sure all exposed leads aren't touching any other
connections, insulate as required, tack in place
with a dab of RTV silicone, or low temp hot glue.
9. Reassemble scanner, make sure to plug the speaker back in.
You should now have a scanner with 100 chs. numbered 01-00 ☐
in 5 banks of 20 ch. and continuous 800 MHz coverage.

WARNING!!! Doing the mod to jumper 4 REMOVED 75 percent of the 800 MHZ
Band on my Scanner. Replaciing the jumper restored the
coverage to design limits, without harming the Scanner.

My serial # is 25021343.

I suspect different boards have been used in this scanner.

ADDITION: My scanner had the jumpers depicted. However, there were 2
more jumpers after those depicted. Disregard any additional

>Also have you tried reinstalling the software or anything like that?

Well, I wouldn't write off the scanner just because the bundled
software leaves something to be desired. Just like ICOM's PCR1000,
Sony's scanner comes with (barely) adequate control software written
in Visual BASIC. Like the PCR1000, Sony won't release the protocol to
the public (1). And, just like the PCR1000, there will eventually be
3rd party software that supports it. In the meantime, it's a damn good
scanner.

(1) According to the Scancat web site
(http://www.scancat.com/rad-list.html), "SORRY - SONY will not
release the protocol. Contact Sony if you want Scancat to support this
product !"

> My ancient HP-41 calculator shows 7.9684196*10^95
>

And my venerable HP-15C reads 7.968419664 x 10^95. That's pretty close
to the Windows Calculator result of 7.968419666276 x 10^95. And,
interestingly enough, if you instead tell the HP-15C to compute e to the
(201 * natural log(3)) you get 7.968420285 x 10^95. So it's pretty
smart, too, knowing how to do the computation without losing precision.

No, I don't want to sell it, thanks. :) Best calculator I ever had.

Hello John, hey I just got a used Pro-34 not long ago and I was just curious about about what you posted about the cellular modification for this unit, this radio already has cellular coverage doesn't it? Or are you saying that you can recieve MORE coverage with a modification? I'm kind of a newbie on this subject but I'm sure that the 34's were made before 'cellular' block because I recieve it easily. Anyway, good luck selling your unit. Vic.

I think the PCR-1000 has a discriminator out and it is labeled 9600 ?(DATA?). It is a 1/8" (mono) earphone jack on the other side of the control port. It function in both FM (Narrow and Wide) modes.
I have been reviewing the "conrolled" scanners trying to decide which to buy.

>Thanks!
>
>Scott Coleman, President ASRE (American Society of Reverse Engineers)

The PCR-1000 looks like a good radio. The wide range would allow me
to "replace" two radios (like I am really going to part with my
Kenwood R2000 or Pro2004[unblocked]) with a much smaller unit.
I have a borrowed '1000'and I am impressed. However iCOMs software
sucks. There are other freeware programs out there. The sensitivity
is good from below 100KHZ [I have never "heard" WWVB at 60KHz before]
to 1090 (ATC transponder buzz). While my HTX100 [Tandy 10MTr 28MHz]
radio is more sensitive the difference is slight. On NOAA APT LEO
WXSAT the 50KHz filter is great. The overall sensitivity is at least
as good as the Pro2004.
Icom also makes a "little brother" to the '1000" in the PCR100. But
it does not have SSB, or CW or [I think] the 50KHz bandwidth.
The '1000' is $399{US at the HamStation} and the '100' is about $325.
For me the $75 is not as important as being able to receive CW/SSB.
The downside is that without a PC the '1000' (and 100 and the TenTec
RX320[HF .1 to 30MHz]) are all just dead little black boxes.
Of course that I why I will [most likely] keep the other 2 radios.
And iCOM makes a DSP filter unit [the UA104 at about $150] that should
help on HF.

My TI-34 (found in the back seat of a car I rented 6 years ago) gives me 7.968419664 x 10^95.

FWIW, this is a really good calculator - even moreso 'cuz I paid nothing for it. It does decimal, binary, hexadecimal and converts from one t'other and all the logic functions like AND OR XOR XNOR etc. I would recommend it - or whatever the most recent version of it is - without hesitation.

Cheers

Message-ID: <RJwH2.52584$rs2.14707568@client.news.psi.net>
Source record: 124928

Fellow Scanner Listeners,

A quick question:

My Bearcat 9000 base scanner, can receive "images" of cellular phone conversations in the 300 MHZ range. Of course it is illegal to listen to these conversations, but theoretically you could listen if you wanted to. Is the Bearcat 3000 handheld "plagued" with this same problem? In other words does it also receive those same cell "images"???

Thanks for the input,

I'm looking at buying one of those 3000's and any input by other 3000 owners is greatly appreciated,

John Lochey

>help on HF.
Correction! The DSP unit is UA106. I think the UA104 is a voice
module for one of the iCOM HF transceivers.
The DSP will remove tones [hytrodynes] and also affers "noise
reduction" in all modes. If it works as the iCOM web site says, it
should extract "voice" from "noise".
I will believe that when I see, er hear it.
I have ordered the PCR1000 and the DSP so in a few days I should know
something.

4192. Char-Meck NC Scanner Question

Newsgroup: rec.radio.scanner
Date: 1999-03-16 00:00:00 UTC
From: jimd7002@aol.com
Message-ID: <19990316133503.13355.00000166@ng-cg1.aol.com>
Source record: 124934

Anyone in the Char-Meck area using a Trunk-Tracker scanner? I'm interested in hearing how well these units work, either RS or Uniden. Are the frequencies hard to setup? Do you catch alot of phone calls being made by PD/FD during the day?

When I was trying to monitor CFD using a regular 800 mhz scanner, it seemed as if someone was always making a phone call through the trunk system, thereby making it hard to follow a particular conversation. Any thoughts/opinions?

Either drop a line here or send an email.

Thanks....

Jim D.

I have, right on 381.7, USCG Air to Ground:(Cell towers are a problem only when close to a cell tower though (Like 3/4 Mile). With that being said, the 3000 is an incredible handheld MilAir scanner. IMHO, it is unbeatable for a handheld. 100CPS allows you to plug in a lot of freqs (and for MilAir, you'll plug in a lot) and listen to them without missing anything. Audio is great, it even permits plug in of headphones. Selectable attenuation for each channer, TurboScan (and search).

Well, yes, you can do that, and I have. However, I don't make the
assumption that everyone's computer is up to date. I used 8kHz, 8bit
mono.

Well, the jury is still out on this one. If the radio manufacturers produce digital compatible scanners as expected then the impact on the hobby might actually be positive rather than negative. How so? Let's use Hillsborough County, Fl, as an example.
When Hills. Co. was on a conventional system the fire and EMS radios were simplex. That meant that you had to be fairly near an event to hear both sides of the conversation. The same with the Sheriff's tactical and talk around channels. Many's the time I missed some good listening 'cause they'd switch to a tactical frequency and I was too far away to hear the car-to-car chatter.
When the county switched to an 800MHz trunked system all the channels began running off the repeaters. This means that you can hear all the comms, no matter where the event is taking place, or where you live in the county.
Hillsborough's system is GE/Ericsson, and with the expected release this summer of Ericsson compatible scanners I think the scanning hobby in this area will be better than ever, thanks to the new technology adopted by the county.
This has been the case in many areas - the listening actually got better after a trunked system was installed (and after the invention of TrunkTracking scanners, of course.)
While I can't predict exactly what will happen as more areas switch to digital it doesn't have to mean things will automatically get worse for scanner users. There may well be advantages we can't forsee.

Catch a clue...there are *lots* of things that you can do in your
own home, which victimize nobody, yet are illegal. So what? Just
don't be the poor fool who gets caught "peripherally"....by this
I mean the kind of accidental stuff that happens when the police
are looking for something completely different than what they find.

You may not have divulged anything, but say the cops come over for
a noise complaint, or they enter with a search warrent, but yours is
the wrong house. Under the plain sight doctrine and the good faith
exception, ANYTHING they find that is illegal is fair game.

Oh, BTW: older TV sets can pick up cellular with the high-end of the
UHF TV band....I kind of wonder if they will be illegal under the new
laws!

> Just goes to show who really runs this country, doesn't it? Write your
> congressbeast all you want, he/she knows where their bread is buttered, and
> that's how these stupid laws get written in the first place.

Sure. Who was it that said "The USA had the best government that money
can buy!"

Look, I have sympathy for the idea that the spectrum should be free for
listening, and it is up to the people who are transmitting to make sure
their stuff is encrypted if they want no eavesdropping. But, civil
disobedience will STILL land you in jail and in trouble if you choose to
do what is illegal. So, you have to ask yourself "Do you feel lucky"
(with
a tip of the hat to Dirty Harry :-)

At the bottom of this post it say it's legal to de-scramble scrambled police traffic in Canada. The last time I checked they would come smashing down on you, its an indictable offense that you can get a maximum of 10 years for. Joe from Canada.

Ok, but average Joe cop isn't going to know the difference between a
cellular scanner or a non cellular one. Even if they did, they probably
wouldn't care.

>

If they entered my house under a search warrant for someone else's house,
they'd have a lot more to worry about than my scanner. The city would be
financing my next mansion in Paradise Valley at that point, along with few
other toys.

>
>Oh, BTW: older TV sets can pick up cellular with the high-end of the

My point is, this new law accomplishes nothing. It's a complete waste of time. Unless someone discloses what they heard while listening to a cellular phone call, there isn't enough evidence to support any charges. Period. The current ECPA already covers things like this.

-Phil

More fun! It may require a bit more knowledge on the listeners part, but
that is part of the game. Also, for many years to come there will still
be analog communications you will be able to monitor.

Geesh guys, I hope this doesn't sound too demeaning to us hams as technocrats but here is my answer;
The cost of a used HT amp right here on the newsgroups is around $50. By the time you purchased a 10dB transistor, new mounting hardware and insulator, heat sink, resistors, fixed and compression trimmers, a bit of coil winding wire, relays, a couple diodes, switching transistor, and a relay, you would exceed this amount, 'unless you had an excellently stocked junque box. . . if that is the case do a search on MRF transistor amplifiers and in about an hour you will have a schematic and PC etching template. Motorola has application notes for power transistors. You could also check the ARRL manuals at the library.
73 and email me direct if you do take this on and get in a bind,
Art k9xf

4218. ** New Windows DTMF decoder program **

Newsgroup: rec.radio.scanner
Date: 1999-03-17 00:00:00 UTC
From: jshima@audiologic.com
Message-ID: <36f02ca9.3679394@client.ce.news.psi.net>
Source record: 124822
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Greetings.

I have developed a DTMF decoder program for Windows 95/98. I have a early release for anybody that would be interested in testing it out... Let me know if you are!

The program needs the following to run:

---
1) A pentium processor and Windows 95/98

2) Installation of DirectX 6.0 (the program uses the DirectSound interface, and you can get DirectX free from microsoft.com)

3) A sound card.

The DTMF decoder meets several Bellspecs so far, it can:

* Detect tones down to 40ms in real time.
* Meets forward and reverse twist specs.
* Meets +/- 3.5% freq. deviation specs.

For those that are familiar with other available software DTMF programs, they are unable to meet these specs!!!

My new detector will decoder tone bursts down to 40ms and in the presence of speech and/or noise. The talk-off performance (false detections due to speech/music) is very low and is superior to other detectors I have tested. The program includes a calibration mode in order to set your system up to detect tones accurately.

A registered version will be available for those interested in purchasing the program.

Please email me if you are interested and/or need other information. Thanks for your time.

Regards,

Jim Shima

I am cleaning out my shack and selling some radios I rarely use. All prices include shipping by Fed Ex 3 day COD. I ship this way only it has proven to be the most efficient. So, I cannot ship to PO boxes. Payments to Fed Ex must be by moneyorder. No checks or cash. Their rule not mine

Drake R8A in great cosmetic and electronic condition includes manual but not the original box. $600 including Fed Ex

Uniden 800xlt 40 channel full factory 800 MHz box, antennas but no manual. Excellent cosmetic and electronic condition. $130 shipped Fed Ex

RS PRO 2045 scanner box, manual and radio in excellent condition, has discriminator tap. $110 shipped Fed Ex

RS PRO 64 handheld box and manual $110 in excellent cosmetic and electrical condtion $110 shipped Fed Ex

Grove SP 200 speaker Sound Enhancer works great looks great $110 shipped Fed Ex

PRO 2004 backlight is gone, cosmetically great cell and 400 channel mods done, has new keyboard overlay to reflect the 400 channels. Works just fine. Includes box, and manual $240 shipped Fed Ex.

Please email me

If you are local to me in the Mpls. St. Paul area we can nogotiate price to save due to no shipping.

Thanks
Greg Renner

VIRUS WARNING!!!!!!!!!!!!!!!

If you receive an email titled "IT TAKES GUTS TO
SAY JESUS" DO NOT open it. It will erase everything on your hard drive.

FORWARD this letter to everyone that you know!!! Lets stop it
NOW!!! This a new, very malicious virus and not many people know about it.
This information was announced Sat, Mar 6, 1999 in the morning by IBM.
Please sare this with everyone that you know on the net. Also, don't look
at or read any mail that says "RETURNED OR UNABLE TO DELIVER" This virus
will attach itself to your computer components and render them useless!!
Immediately delete any mail items that say this. AOL has said that this is
very Dangerous virus and that there is NO remedy for it at this time.
Please practice cautionary measures and forward this to all your online
friends ASAP!!!

The only way to fix this is to download all the memories to your
computer using the published software and change the mode from auto to
whatever the service must be, like AM for the SW broadcast stations.
THen upload this back to the radio. Worked for me.

If you don't use the computer then each memory must be re-programmed via
the keyboard. Yes, it is very time consuming, thats why I use a
computer.

THis glitch is a published bug, mentioned in all the reviews I have seen
and reseting the X10 will not fix it.

good luck...

David,
Your enthusiasm for entering the radio scanning hobby is terrific.
However, The AOR AR8200 is a high end scanner that is not simple to operate.
In fact I have seen a few posts on this newsgroup of people selling their
radio because it was too technical for them. I would recommend one of the
RadioShack or Uniden scanners for starting out. Those models are becoming
quite advanced with improved search features and the ability to follow
trunked radio systems. They are also much easier to operate.
Here in the United States it is not legal to monitor cellular
telephones. There are laws that make it illegal for radio manufactures to
sell scanners that are capable of being modified to receive cellular radio
frequencies. In other countries they have similar laws, but because the
cellular band may be in a different portion of the radio spectrum than here
in the U.S. or because the cellular signals are digital and therefore
resistant to monitoring, they have radio models that here in the U.S. would
receive in the cellular band.
Folks that buy a scanner so that they can listen to cellular phones
often get bored of the hobby pretty quickly. Private phone conversations
are often dull and monotonous. Ocassionally something funny or mildly
interesting can be monitored, but please you have to be pretty lifeless if
you have to monitor private conversations for entertainment. Today more and
more cellular phones are digital and more resistant to monitoring in the
first place. There is a lot more exciting things to hear on a scanner than
phone conversations, such as the police, fire and EMS. Airplanes, trains,
taxis, busses, race cars and their crews, news reporters, traffic reporters
and various electronics like wireless microphones are fun to monitor.
There would be some pitfalls to getting a foreign model scanner or
modifying a current radio model. If you buy a foreign model you will have
to order from a company in another country. IF the radio made it through
customs you would not be able to get repair support for the radio. If I am
going to spend close to $1K to get a radio I would want to know that someone
would fix it should something break. On a foreign made scanner the step
rates and the bands would be different than in the U.S. While this would
not prevent the radio from working here, it would make it inconveinent. If
you were to be able to modify a current model radio scanner (one built in
the last couple of years) then it is likely that the regulatory agencies
would "de-certify" the radio and dealers would have to return their product
to the manufactures and the manufactures would not be able to sell the
radios in the U.S.. The reason that RadioShack will not sell service
manuals for newer radio scanners is because people use them to learn how to
modify radios. I am sure that RadioShack has suffered financial loss on
some models in the past because people hacked into them and then published
instructions to modify the radios on the Internet and in books, which
resulted in "de-certification."

So get a RadioShack Pro-90 or a Uniden BC895XLT first, then if you like the hobby move up to the AOR8200.

If they go digital, and a lot more will be converting this year, it may end a lot of listening in. A lot of the systems coming out using digital just sound like an open squelch, and to crack them is nearly impossible.

What's the problem with the price?

I see Pro-43's for $250 here all the time, 200 channels at a $1.25 a channel.

Pro-43, $400, 800 channels, that's $0.50 per channel.

Sounds reasonable to me!

By the way to the BRAVE person that called me an asshole, you must be a CB radio operator, call people names and hide who you are, BIG BRAVE CB RAMBO!

>Does anyone have an Icom R-2 reciever?, if so can you tell me if you
>are happy with it

Hi Gregg,

Well I just received my R2 today from Lentini. Have only had a couple hours to play with it but so far I am very impressed. First the good things.

1) Seems quite sensitive, even on AM broadcast band.

2) Doesn't seem to have much of an intermod problem, and I am in a pretty dense RF area, just a few miles south of Detroit. A few freqs get hit by pager interference, but so does every other scanner I have tried.

3)Seems to be well constructed and the size is absolutley perfect, although I will try to find a shorter antenna for it. It uses an SMA connector, makes it a little harder to sub antennas.

And the only negative I can say so far is that programing is not very intuative. It might make sense if you are used to Icom, but I am more used to GRE scanners. I'll get used to it I am sure, and I will no doubt pop for the computer interface when it is available.

I'll get a good chance to put it through its paces over the weekend. I can post more thoughts then if your interested.

Regards .. Larry Fowkes

>Any ideas where to get a replacement part?
>I'm capable of putting it in myself.
>Thanks for any help.

You could probably get away with using either an 8 volt or a 6.3 volt regulator. If you need exact 7 volts, you could get a lesser value regulator and raise the voltage in about .6 volt increments by stacking silicon diodes in series with the ground reference lead. 1N914 should work well in this case, be it a three pin reg. IC or just a zener diode.

From: Keith Rainbow <rrainbow@cc.curtin.edu.au>
Message-ID: <7cq5fj$dm7$1@ftp.curtin.edu.au>
Source record: 124759

I need a UX-14 parallel to serial converter in order to computer control my Icom IC71.

Since Icom apparently no longer produce this, I shall just have to make one. I doubt if it it is much more than a basic UART but I don't really know.

Can anyone point me to a source of the circuit diagram and possibly also some rough idea of the original layout? Currently I only have the drawing showing how to install it in my IC71 manual.

I've got a vague notion I saw the circuit once in that excellent but now defunct U.S. publication "Ham Radio". Can anyone confirm my failing memories?

To the best of my knowledge, the 2002 did not come with a computer port on the back.

The AR 2515 did come with a port, and was shipped with casings made for the 2002. Mine has a model 2002 stamping on the back side.

You might have a 2515, rather than a 2002. Either one was a good receiver, but for somethat different reasons.

The 99 channel radio is extremely flexible in it's sequential tone signalling. This makes the radio very flexible but more complicated for programming.

I will be e-mailing you the programming sequence.

Now, now, cost-effectiveness isn't the only reason to homebrew, is it?
Without wanting to start a thread on the philosophies of homebrewing,
it must nevertheless be stated that the desire to build need not come
solely from a desire for economy. Such a view, stated alone, reflects
an egocentrism on the part of the speaker/writer.

> if that is the case do a search on MRF transistor amplifiers and in about an
> hour you will have a schematic and PC etching template. Motorola has
> application notes for power transistors. You could also check the ARRL
> manuals at the library.

Now, here is the egocentrism-destroying part! Well written, Art.
Don't forget that the 1998 version of the ARRL handbook has an article
in it on a 2m amp using one of those RF power modules.

There's also a guy on qsl.net who parallelled 4 (count 'em, 4) 70cm
power modules to make a 100-watt power amp. Go to www.qsl.net and
perform a search for "amplifier" to find it... Interesting stuff!

Hi,

I'm trying to get the Security frequency for State Street Bank in
Quincy, MA. They've got those little 2-way Motorolas...

Anybody happen to know it?

Thanks,
Darren

The truth is John, most people don't have to brag about not losing an account. For most people, that is normal. Most people don't do things that would cause them to possibly lose their ISP, unlike you.

Please take this junk to email John. Nobody here wants to hear it anymore.

>finding them. I,m ready to stand next to patrol car or station with a
>freq counter.
>

Try looking for anything licensed to your city with a service code of G*
(G-anything) in the 800 Mhz band.

Another thing to try is to fire up MDT Monitor and then do a search of the
800MHz band (or the 453's, sometimes you'll find them there). MDT channels
are pretty busy, and MDT monitor will tell you if it's a valid MDC-4800 MDT
frequency. If you find one that sounds like MDC, only faster, then you've
found an RD-LAP frequency. Make a note of it, and wait - I'll be releasing a
decoder app for it soon, hopefully.

I have 2 Realistic Pro-2006 scanners covers 25-520 mhz and 760-1300 mhz, (minus cellular). Some of the features of this extremely popular unit are 400 channel memory, am/fm/wfm mode selectable, direct frequency search, 10 programmable limit search banks, 2 speed scan and search, lockout, delay, lockout review, step search select, priority and sound squelch. It has jacks for an external speaker, headphones, and tape out. Clean unit's in EXCELLENT condition. Both radio's are very clean and in perfect working condition with no backlight problems. You will receive the scanner, telescopic antenna, original manual and box. The cellular modification has not been done. (easy to do thou, just open top of scanner and clip a diode). The serial numbers and FCC ID's of the radio's are (SN 009929 & FCC ID AA020-145) & (SN 024555 & FCC ID AA020-145). Asking $290 + shipping for each radio. If you have any questions I will be happy to answer them.

To see a picture of the two scanners go to the following:

My Bearcat BC9000XLT has a ground hum when I connect the external output to my mixing board. I have the Bearcat connected to an electrical outlet that is grounded just fine. The Bearcat power adaptor has 3 prongs, and using an adaptor to go from 3 prongs to 2 lessens the hum to the point that you have to really try to hear it. I don't really like this solution though. I want to open the unit and solve this problem. Has anybody done a fix like this on a BC9000XLT? What did you do to solve it? Any tips on solving this problem once I have the unit opened?

Thanks for all your help in trying to get my scanner back working.
Now....i'm looking for a fixed voltage regulator #7807.
Radio Shack was no help.
I have a Uniden SC150 and i hooked up the wrong power supply to it
one day but thats another story.
Why Uniden put in a rare and hard to find regulator is beyond me.
5, 8 and 12v seems common....not 7v.
If anyone knows of a web site or has one laying around....i would like
to purchace it.
lmk and thanks for any help.

Rick

Let me guess. You are using using an external antenna with its own ground on the radio - or your mixing board is grounded via a different means, possibly by virtue of the other equipment that is attached to it.

This is called a ground loop. Ideally you want everything in your system grounded to one point only. Let me know if I can help more.

I wish it were that simple. The BC9000XLT and the mixer are plugged into
the same grounded outlet, so they're both at the same ground point
in theory. And I'm just using the antenna on the radio, no special stuff.
Weird huh?

As far as I am concerned, it has been the best overall scanner I have owned, and I tend to own the best available at any given time. I also have a AR8200 which is no where near as sensitive. If you can get beyond the "not having a numerical keypad thing" it is the best thing going, especially for the price.

Sounds like it is about to go south on a permanent vacation. I saw a 2006 do the same thing and the display eventually died.
They are fairly easy to replace and can be ordered through Radio Shack. Not cheap, though, around 30.00 for a new one.
I'm not saying this is the exact problem, but it sure sounds like it. Does it still flicker when you switch the dimmer from low to high, or vice-versa?

If you want the most complete decoding package you need the program PocFlex and an external 4-Level FSK decoder. The program WinFlex only decodes 2 levels of data and you will only receive half of the data.

You can get a really nice 4-Level FSK decode from Texas 2-Way. They are really well built and work very well for not a lot of money. I bought mine from Texas 2-Way. The DDM-4 decoder box hooks into your discriminator audio and then goes through a serial cable into your computer. I leave mine hooked up all the time and have used it for 3 months straight. Very durable and dependable. You can reach Texas 2-Way at (956)702-2481 or by email at n5sim@aol.com

>Radio Shack was no help.

No surprise here. Their stores are loaded with a bunch of losers. What else are you going to get for $5 and hour and all the batteries you can steal. I have had nothing but trouble with Radio Shack for ages. I have met with the District Manager down here a few times and he is just as bad.

>Now....I'm looking for a fixed voltage regulator #7807.

Try Digi-Key. They carry Harris electronics voltage regulators. If you can't get one from Digi-Key call Harris direct. It will cost you a bunch more money but it may be the only way you can get them.

Maybe not, maybe so. Like I said, "Do you feel lucky?" :-) Really, just
be careful.

> My point is, this new law accomplishes nothing. It's a complete waste of
> time.

No argument here! But really, MOST laws accomplish very little, they are
merely the result of special interests with lots of free money waving
dollar bills under the noses of some people who write the laws. There
are
so many pages of laws and federal rules that it is impossible for any
one
person to comprehend it all.

> Unless someone discloses what they heard while listening to a cellular
> phone call, there isn't enough evidence to support any charges. Period. The
> current ECPA already covers things like this.

Except in the case of modified scanners under the new proposed laws. It
is
my understanding that mere possession of a modifed scanner under HR 514
will
be a crime.

Ignore the spamming BS you may get here Dan,
Ofcourse you can HB an amp.. I have many of times. It's fun and a great learning experience.

It's a shame there are so many "appliance operators" hanging out on VHF but with today's ease on licence requirements I guess we get what we get if we're going to keep the hobby alive.

I have used many different sources from CCI to RF Parts Ramsey sells an OK kit at a decent price but the best performance I ever had was by using an old VFH Marine Tube rig. and converting the PA to 144 Mhz WORKED GREAT on SSB and FM.

Good luck and don't let the CB'rs get you down... <= That should stir up some interesting discussion!

I have 3 AOR radios and they will also pick up shortwave signals. last night at "lunch" time, I was listening to shortwave as I was eating my lunch. Using the external antenna on my truck, I was getting pretty good signals. I also sometimes listen to shortwave when I am driving through the desert and don't get decent AM. or FM signals. Sometimes, I listen to TV audio too

scanners are great, they give real time information and news

4322. REPOST: Homeowner Association Tips

Newsgroup: rec.radio.scanner
Date: 1999-03-19 00:00:00 UTC
From: allsafe <Nuh-uhh!@INVALID.com>
Message-ID: <36F30DB6.711778F0@INVALID.com>
Source record: 124645

So what happened? You mounted your antenna on the roof and now the homeowner's association is after you about that *THING* on your roof muckin' up everybody's view of the suburban skyline?

You think you'll have to take it down?

Maybe not.

Why don't you try a few of "allsafe's tips for dealing with homeowner associations who don't like external antennaes"

Homeowners associations traditionally serve some sort purpose. I don't know what it is, but I'm told there's purpose in there somewhere. One of our "officers of the board" said it had somethin' to do with the upkeep
of our "common grounds":

"What common grounds?" I asked.
"Down there" he said, pointing to the end of the block, "You see that "Windwoods" sign? That's common ground."
"That little patch of grass around that sign way down there is our ï¿½common ground'?" I asked.
"It sure is" he said.
"We don't need an association to take care of that; all we need is a friggin' ï¿½weed-eater'."
"Oh, now we do other things Tom."
"Like WHAT?"
"Well...for example: There was quite a bit of discussion during the last board meeting about that antenna you've got on your roof ....."

Uh-Oh. Gotta stop this conversation fast. You can't enter unprepared into a discussion like this and hope to keep your antenna on your roof. What you need to do is acknowledge the board member's concern and gently divert his attention away from the antenna and towards any concerns *you* appear to have:

"Uh... look Steve....Sorry to interrupt, but I seem to missing a couple of copperheads and I was wondering if you've seen ï¿½em?"
"Copperheads?"
"Uh-huh."
"As in SNAKES?"
"Yeah-yeah: Snakes..... Jeez, whadda I gotta do? Draw ya a friggin' picture?"
"Let me get this straight Tom; You're keeping POISONOUS SNAKES IN YOUR HOUSE?!?!"
"Well.....not anymore."

"not anymore?"
"Well....duh. If I was still keeping ï¿½em at my house I guess I wouldn't
be
asking you ï¿½bout them, now would I?" (Steve can be so stupid
sometimes.)
"So now we've got a couple POISONOUS SNAKES roaming the neighborhood?
Do you have any idea how dangerous that is Tom?"
"I thought it might ruffle a few feathers." I said. "But I feel like I
should ask you. Hell, it took me two days just to gather gumption to
ask.....Hey!...THERE'S ONE! Oops. Sorry; just the garden hose.
Hey! Where ya goin' Steve!?!?"

When the board member departs, it would be a good idea to scamper inside
yourself. You've got some work to do if you're going to convince the
Homeowner Association to ingnore your antenna. You've got to make some
changes. Bold changes. This is about power. You don't go to the
homeowner's association; you make the association come to you:

DING-DONG!
"Well howdy Steve! What brings ya out on this fine Saturday morning?"
"Hello Tom. Listen, the board's still a little concerned about that
roof-top
antenna, but they're a little more concerned about some recent changes
you've
made to your residence."
"Like what?"
"Can you step out here? Thanks Tom. Look there; they're concerned
about *that*."
"That?"
"That."
"Aw hell Steve, it's just a little maintenance. The house came with
white siding and black trim, but the trim's faded and it's real hard to
match that paint now.
I just went with a slightly different shade."
"Florescent green Tom," Steve observed, "your garage door is florescent
green. Look at it Tom. Can you honestly say that ï¿½maintains the
original color scheme'
of your house? That's what your supposed to do. It's right there in
your copy
of the bylaws. If you do anything else, you have to get board approval
before
you change the color scheme. And I can tell you right now Tom, the
board
would have *never* approved that."
"Hell Steve, it ain't done yet."
"You mean that's primer?"
"Uh...no. I meant I haven't put the racing strips and bald eagle decal
on yet."
"Oh Gawd." he said.
"It's gonna look cool!" I said.
"Look Tom. You simply can't do this. You may think it looks fine, but

other people are quite adamant that your color scheme is going to lower the property value. That's what we're here for, to maintain the neighborhood and assure that changes to residences don't adversely affect other residents. Can you understand that Tom?"
"Okay-Okay, I'll re-paint the garage door back the way it was. No need to get yer panties in a bunch. Say...that reminds me, how's that daughter
of yours doing? I saw her the other day and she's really blossomed into a sweet young thing. Hasn't she?" I asked.
"Yes. She's quite a young woman...."
"Have you been payin' her to wash your car? ï¿½Cause if you ain't, I'd be glad to."
"Now look here...you can't..:"
"Of course I don't get to see enough of her with my radio hobby and all."
".....Okay Tom, are you going to take care of that garage door?"
"Sure Steve; whatever makes ya happy."
"Goodbye Tom."
"Buh-bye Steve!"

Next installment: How to get the association to ignore a sixty foot tower!

I tend to agree Bud, I would have to be crazy to accept his apology.

What is funny, is Al is a real person. Now how many real people have actually stepped up and supported John Mackey? What kind of person would actual lend support to John? Spooky to say the least.

I have radio shack rabbit ears hooked up to my scanner and I was wondering how much range that has?

Also can anyone tell me a good attenna that is under $20 that gets a good range? Thanks

You hit that one on the head. It is already illegal to intercept encrypted transmissions in the U.S. The damned cell phone companies didn't want to spend for the technology, when buying off a few brain dead politicians is cheaper. We are fast becoming the land of laws. We have an apathetic populace in this country that find the likes of Oprah, Jerry Springer, and the latest Clinton trysts, high brow intelectually stimulating entertainment. Our "elected leaders" find it necessary to pass these cradle to grave laws to keep us from poking our eyes out. So, once again a law is passed, people now crave the taboo cell calls, and the U.S. government once again creates a black market industry for unblocked radios. Think this is bad, just try to re-charge an old air conditioning unit that uses R-12 refrigerant. The stuff was outlawed a few years ago to "save the ozone" and now we have "reformed" drug smugglers smuggling R-12 into the U.S. because it is more profitable.

Hi All,

I have seen some post about similarities between the Pro-2050/Pro-90 vs the BC895/BC3000. But when I went to my Radio Shack we could not find the scanner to RS232 port. Is that omitted from the RS models and do the RS models have CTCSS boards? If the RS units don't have the RS232 and the CTCSS is it an option or possible modification?

Thanks Joe. Remove NS from reply to address to reply.

If you can't get the clip you can still order the leather case for
twenty bucks. It has a clip on it. They previous owner probably had a
case for it. I had to take the clip off mine to put it in the case.
It is a super scanner. Good Luck

>Thanks for all your help in trying to get my scanner back working.
>Now....i'm looking for a fixed voltage regulator #7807.

You can use a 5 volt regulator and lift the center lead above ground through a resistor. This will increase the regulated voltage output. Try it in a very simple external setup with maybe a 10K pot between the regulator center lead and ground. Zip the pot until you have seven volts out, then measure the pot and substitute a fixed resistor. Or leave the pot. If you're all the way to one end of the 10K pot, drop down to maybe 2K.

It's done all the time and is reliable.

> n5sim@aol.com

WinFlex will work with 2 Level or 4 Level FSK decoders and will decode
POCSAG (2400, 1200 and 512 baud), FLEX (6400bps, 3200bps, or 1600bps)
and GSC (Golay).

A 2 Level FSK decoder (data slicer) will only decode Phases A & C of
FLEX transmissions (no matter which software you use).

Does the 4 Level FSK decoder that Texas 2-Way sells differ from the 4
Level FSK decoder on the POCFLEX web site (i.e. are the RS-232 pinouts
different)?

BTW, the decoding routines in WinFlex came directly from POCFLEX (so
whatever POCFLEX decodes, WinFlex should also).

The MVT-7100 has long been considered the de-facto finest scanner that ever came down the pike as far as sensitivity is concerned. This has nearly always been the case with Yupiteru built products (including the Yupiteru built Relm's). While the others you mentioned have their merits, they are in NO WAY in the same league as the 7100.

Boy, do I agree with you! It's ridiculous that so many people want to monitor something that is so "transitional" - meaning that the conversation(s) disappear within 1-2 minutes!
Apparently lots of people don't understand how cellular works! I enjoyed your posting and share your beliefs!

4358. window edge mount antenna questions

Newsgroup: rec.radio.scanner
Date: 1999-03-19 00:00:00 UTC
From: riechert@my-dejanews.com
Message-ID: <7cu12g$8a8$1@nnrp1.dejanews.com>
Source record: 124717

I've got 2 fairly large vehicles (minivan and Land Cruiser) that I'd like to equip with some sort of out side antenna for use with my dual band amaateur HT. Since they're kept in a garage, anything very tall would get in the way of going in and out of the garage. So I've been considering a window edge mount that uses the HT's antenna.

Advantages I see:
- Relatively inexpensive.
- Easily moved from one vehicle to the other.
- Stock HT antenna is short so should be able to go in/out of garage
- Easy upgrade to better HT antenna

Disadvantages I see:
- Mounts at Radio Shack and HRO have only 6-7 feet of cable
- Size of mount may prevent window from fully rolling up into the surrounding frame

Any general comments especially relative to the disadvantages I listed? Any other comments? Thanks in advance.

Jerry Riechert

4359. Re: Alinco DJ-X10 software?

Newsgroup: rec.radio.scanner
Date: 1999-03-19 00:00:00 UTC
From: baptpdc@we.mediaone.net
Message-ID: <36f279c2.1522249@nntp.we.mediaone.net>
Source record: 124718

Actually, the DJX10 CAN be controlled by software, but it seems to be nothing more than front panel stuff. It should be possible, (I say "should" since I haven't tried it yet,) to control the scanner from the PC, but there are no provisions for carrier detection. This makes it kind of hard to use it as a PC scanner. In effect all you'd get is a remote keyboard with a status window.

Lately, I've been thinking of implementing some form of control, but given the existing DOS environment, it might be kind of lame.

Give me some ideas on what you guys would want a control module to do. Remember the DOS environment...be reasonable.

About 1/2 the calls I listen to do NOT drop within a few minutes. Why?
Because people are calling from their portable while NOT in a car.

These calls do not change cell sites.

jets1961@hotmail.com wrote:
> I have seen some post about similarities between the Pro-2050/Pro-90 vs
> the BC895/BC3000.

Little similarity between 2050 and BC895. The BC235XLT and PRO-90 are
near identical with the 2050 being a base model version of the 90.

> But when I went to my Radio Shack we could not find
> the scanner to RS232 port. Is that omitted from the RS models

Not omitted as the 2050 is simply not based on the 895 but the 235/90.
2050 doesn't have the the RS-2323, S-meter, weather alert, rotary
tuner nor CTCSS decoder/squelch.

> and do the RS models have CTCSS boards?

No CTCSS on the 2050. And it's not a plug-in option on the 895 like
it is with the 760, 890, or 9000; it comes standard.

> If the RS units don't have the RS232 and
> the CTCSS is it an option or possible modification?

RS232 is out of the question. CTCSS squelch control would require a
VERY hefty mod although you could do decoding via a PC soundcard and
software.

For sale:

I have for sale eight Kenwood Tk-806 commercial/LMR radios. I have three radios which are working (tested tx and rx, carrier, pl, and dpl on both band edges) and five with various problems. I'm sure that the non-working five could be put together to make two or three good, working radios, but I don't want to worry with it. These radios are UHF, 470-490 split (I have been told that they will work 460-500, no guarantees on this though!) and 16 channels. They are very similar in function to a Motorola GM-300, with a few differences. (Couldn't find a pic, sorry...) The first difference is the size. The radios are roughly 5.5" wide x 6.5" deep x 1.5" tall. Second, the radios have an orange-backlit quasi-alpha display (eg Ch 1-Ch 16). Each channel set to repeat has a talkaround which is selectable by a single button (changing the display to Ta 1-Ta 16). Also, the front panel has a second button for monitor/open squelch, power push-on/push-off switch, volume control, scan, scan list delete/add (it's very easy to reprogram the scan in these) and REC for option boards such as DTMF decoding and tone signalling options, as well as the RJ-type mic connector and the channel-selector knob. The radios are at least 30 watts out within their bandsplit- I can't remember the exact figure but they may be up to 45 watts.These radios also support hang-up functions, programmable scan timings, TPL/DPL/InvDPL, etc.

Anyway, I would like to sell these radios as a lot. I think that $300 each for the working radios and $250 for all five of the dead ones is fair- total $1150. I think that this price is fair; if you don't, make an offer.

NOTE: I do not read these newsgroups. PLEASE E-MAIL ME AT TVSJR@SPRYNET.COM!!!!!!

Thanks
Terry

Shame on you. There's a whole lot more to amateur radio than spending money. What Dan is wanting to do is both legal and beneficial. If he builds the amp and you buy one, he'll know a lot more about it. Find something constructive to say or move on.

Newsgroup: rec.radio.scanner
Date: 1999-03-19 00:00:00 UTC
From: jtward01@aol.com.nospam
Message-ID: <19990319155848.22004.00000038@ng-fy1.aol.com>
Source record: 124728

On Friday, 03-05-99, Adam Brock of Glen Burnie, Maryland posted the following on rec.radio.scanner:

"BC-3000XLT with all original accessories, including nicad, charger, rubber duck, box, manual.
Scanner is in very good condition. Covers 25-1300 mhz less cellular and 550-760. Selectable
modes are am, wfm and nfm. Full coverage of mil air freqs. Picks up cellular on 1005.5 to 1015
mhz. $200.00 shipped."

I responded to the ad on Saturday, 03-06-99, and advised Mr. Brock that I wanted to purchase the scanner. On Monday, 03-08-99, I received the following message:

"Okay, sorry I didn't have a chance to get to the computer until now.
Here's my address.
Adam Brock
7996-D Silent Winds CT
Glen Burnie, MD 21061
410-768-9897"

On Tuesday, 03-09-99, I mailed to Mr. Brock a money order for $200.00, expecting him to ship
the scanner the same day via USPS Priority Mail. Since Priority Mail usually takes two to three
days I expected to receive the radio on Friday, or no later than Saturday. When the radio did not
arrive by Saturday, 03-13-99, I sent him another query regarding its status. He replied via e-mail
that the scanner HAD BEEN SHIPPED. When I pressed for details on when and how the radio
was shipped I received the following reply.

"John,
The radio was being sold for a friend. I did not get the radio from him until Friday (when your money order arrived). I do not generally ship out items on "good faith", I ship as soon as I receive payment. Nevertheless, the radio is no longer for sale. The other involved party has changed their mind. I am sorry, and your money order will be returned to you tomorrow morning, via Us Mail."

Interesting, eh? If the radio was withdrawn from sale by the owner then why did he say on
Saturday that the radio HAD BEEN SHIPPED. This was the first clear lie.
Later that day, Sunday, 03-14-99, I checked with the store where I purchased

the money order
and I was told that since the money order was made out to Adam Brock I would not be able to
cash it or get a refund at the store. The clerk said the best thing would be for Mr. Brock to cash
the money order, then purchase a new money order and send the new one to me.
I e-mailed this information to Mr. Brock, plus I called his home telephone message and left the
same information on his answering machine.
The following day, Monday, 03-15-99, I received another e-mail from Mr. Brock, this time
saying the SCANNER would be shipped via Priority Mail on Tuesday, 03-15-99. This is the same
scanner that was supposedly shipped the week before, then supposedly withdrawn from sale.
It is now Friday, 03-19-99, the mail has arrived, and there is still no sign of the scanner. I can't
help but wonder if Mr. Brock told me he was sending the radio simply as a delaying tactic in order
to give the money order time to clear his bank before I could put a stop payment order on it.
At this point it looks like I've been screwed for $200. If there is anyone on the newsgroup who
has had any luck in prosecuting a similar case of interstate fraud via the Internet please contact
me. The U.S. Attorney's Office here in Tampa is very aggressive in prosecuting Internet crime and they've taken a report and are
investigating to see if there's any precedent for filing criminal charges. If I could cite some similar
Internet fraud cases with successful prosecutions it could help them with their decision.

4372. PRO-2050 Trunk Tracking

Newsgroup: rec.radio.scanner
Date: 1999-03-19 00:00:00 UTC
From: pscolombo@aol.com
Message-ID: <19990319164149.18777.00000075@ng-da1.aol.com>
Source record: 124731

>I have a Radio Shack PRO-2050.

>don't understand trunktracking

Biggest help that I can be is to ask you what area do you live and what Motorola trunked radio systems are in use in your area? From that we can get you programmed and you can start picking up talk groups.

Trunked radio systems (TRS) use anywhere from 5 to 28 frequencies in a 'trunked pool' of channels. Each radio has a unique number or "ID" to the TRS computer. Each of the radios is setup with talk-groups, which are nothing more than groups organized by function. Consider the following small-town scenario:
Police Fleet-1
Group# Use
1616 Main Dispatch
1648 Tactical
1680 Detectives
1712 Vice Squad

Fire Fleet-2
3216 Main Dispatch
3248 Tac-1
3280 Tac-2
3312 Ambulance Dispatch
3344 Patch to Med-9

Local Govt Fleet-3
4816 Garbage Trucks
4848 Traffic Dept
4880 Street Maint
4912 Sewer Dept
4944 Water Dept

In this setup, if the Police Dispatcher keys up their mic to talk, the computer recognizes that someone in talkgroup #1616 wantsto talk and instantly assigns a frequency for that talkgroup...all the radios in that talkgroup switch to that frequency and hear the radio traffic. If a patrol officer keys his radio the same process occurs. As soon as that group is done talking, the frequency is returned to the 'pool' by the computer. The next user on the TRS might be a garbage truck and when the operator presses his mic, the computer picks a frequency and all the radios in his talkgroup switch to that freq. It all happens in milliseconds. Trunk Tracking radios allow you to follow these talkgroups as they talk back and forth.

You would program in all of the TRS frequencies into a bank of your TrunkTracker, then hit the search button. As any of the groups become active

their group numbers display on the TrunkTracker radio. As you continue to search, you can keep a listing of talkgroup numbers and what type of traffic you hear and make out a fleet map of your own. As you determine what groups you "don't" want to hear, you lock them out of the search/scan sequence and then you are only listening to your favorites.

Chances are...if you are near a large TRS, somebody has already mapped out the fleet and has some info posted on a website. If you want ... send me an e-mail back with the name of the city/county where you are located and I will see what I can find.

I prefer to do this by e-mail rather than newsgroup posting to reduce the amount of 'flaming' that seems to come from some of the know-it-all's out there.

I have several Uniden TrunkTrackers and one Pro-2050. Let me know if you want a little more help.

So what everyone is saying is that they need no more than 200 channels
in a handheld scanner?

As I stated this scanner has 800 channels 4 groups of 200 channels
each.

Source record: 124875

I have the following for sale:

1. Icom "MB-12" Mobile Mounting Bracket (Quite Heavy) Will work with the Icom IC-R70, IC-R71 and the IC-R7000.

2. Yaesu "MMB-28" Mobile Mounting Bracket for the Yaesu FRG-9600 Receiver

Both are in EXCELLENT condition. There is NO SCREWS or BOLTS with either of the brackets. I'm selling ONLY the brackets.

I'm asking $19 for the Icom bracket & $9 for the Yaesu bracket. Buyer pays shipping.

If you have any questions contact me at the following:

Hello,

Wanted: URL Links to "no gap" scanner sales.

I would like to add a new feature to my site.
A page that gives direct URL links to companies that still sell
new scanners that get the "illegal" ranges (No gap scanners).
If you have a company or know of one I request that you e-mail
me the link to the site. I think most are in the UK, Canada, etc.
Please send e-mail to ScanShack@aol.com

Thanks for your time.

It does 4 banks of 200.

I imagine it could be made to scan the full 800 but with the limited
room in the scanner I doubt it would be feasible.

Find it at
http://www.iaw.on.ca/~jabba/pro-43.html

Greetings,

I'm not sure I understand your question. You would just program in the
frequency you want to listen to, the CTCSS codes will not stop you from
hearing everything that particular frequency has to offer. The dept.
using CTCSS will still be heard on that frequency. The sub audible tone
will have no effect on a scanner without a tone board.

I believe they are, but they are digital.
Does anyone know if they have a test or monitor mode
like some cell phones do. I have to take one home every night
and wouldn't mind fiddling with it.

There you go John, proof. Of course you will deny it. Somebody else will confirm it and you again will come up with another lame excuse why you are right and the WHOLE world is wrong.

This also confirms your obscene and rude behavior on the repeater which you deny. Notice you quit using the Marcinko lie since you didn't even know his correct callsign.

Lie away John-Bowl, but take it to alt.fan.john.mackey.

4401. Dear cellular customer, H.R. 514

Newsgroup: rec.radio.scanner
Date: 1999-03-20 00:00:00 UTC
From: scanshack@aol.communicate
Message-ID: <19990320102052.28621.00000260@ng33.aol.com>
Source record: 124588

Dear Cellular Customer,

As you drive in your vehicle talking on you cellular phone did you ever
notice those many signs posted along the roadway.
Signs with numbers on them. Those are called
Speed Limit Signs. They advise you of the posted (legal) speed you MUST
not exceed. If you did exceed that posted speed you would be breaking the law.
Breaking the law, it is done by probably 99.9 % of the drivers on the roadways.
A law is put there to be followed but do we follow them ?
Another law that may interest you cellular customers is the law that says
it is unlawful to monitor a cellular phone conversation with a radio receiver.
H.R. 514, a bill supported with profits from the cellular phone industry,
is currently being voted upon by the law makers. It is attempting to
strengthen laws that are already on the books to prevent people from monitoring
your "private" cellular phone conversations on your analog or digital cellular
system.
Think about it as you drive and talk. Do you think a law is stopping people
with
radio receivers from listening to you ? Does a law stop you from speeding ? I
think not.
What you should do is contact your cellular providers and let them know that
what
they should really be doing with their profits is fitting their cellular
systems with
some real security. Something like digital encryption to protect your
"private"
conversations. H.R. 514 will probably pass but your "private" unsecured
conversations
will still be available on the radio airways to be received by people with the
receivers
capable of cellular reception. There are millions of these radios out there.
Do yourselves a favor. Make your conversations really "private" with the help
of your cellular providers, their profits and a little bit of available
electronic technology.
Its your money and your conversations. A law is not going to do it !

Source record: 124590

Yeah, and this applys to all scanners. Cut a 5ft hunk of speaker wire and terminate one end of the wire (bare) to a large alligator clip. You can terminate the other end without using an actual wire connection as it will allow you to orient the wire by clipping it onto drapes or the like. Take the terminated end and clip it onto the knurled portion of the bnc connector for frequencies below 100mhz on vhf and for everything above 100mhz connect the clip above the insulator (if you are using a telescopic antenna which works better to begin with). The can make dramatic improvements in reception of the 30-50mhz range (cordless phones) and also does a great job for shortwave and everything else. Only costs a couple of bucks if you don't have the parts laying around.

You will be able to hear the radio traffic the same as any non-CTCSS
enabled frequency. CTCSS only plays a part when the receiving statios are
CTCSS enabled. Two agencies can use the same frequency... If they have
CTCSS enabled, a receiving atation would only hear the one that has the
same ctcss tone enabled as the transmitting station. This is great for
scanner users who only want to hear one of those agencies. If your
scanner has no CTCSS you would hear both agencies, regardless of what
ctcss tone they use.

I have a Antenna Specialists over-the-window antenna that I use with the TNC-BNC adapter and have gotten minimal results, too. I can't compare it with the OEM rubber ducky because the pin fell out of mine, rendering it useless. Why can't someone make a high-performance mobile antenna that can pick up not only 800mHz, but the rest of the Public Safety spectrum too...?????

Frustrated while Mobile...

Even if they don't, there are plenty of third parties who are jumping
in with decoding solutions - all your scanner needs is an NFM
discriminator output.

Personally, I'm not convinced that a "trunk tracker" scanner is worth
the extra cost. At the rate things change in the digital world, it
won't be long before today's scanners with built-in trunk tracking
decoders will be obsolete. Better to have an external module which you
can swap out when you need to monitor some new encoding scheme.

I would like to tap the discriminator in my PRO-2006 for MTD decoding, I have the OS456 board installed, would installing an external RCA plug type tap and using a dataslicer cause any conflicts? Does any one know if it is possible to decode MDT's with out making any mods using just the OS456? Already tried decoding through my soundcard with no sucess. Any help would be greatly appreciated.

Kind Regards

Doug.

Hello,

B/C895xlt f/s best offer. I purchased the scanner for Christmas and have not been using it much (playing too much golf...). I will include the 1999 Police Call, 1999 Betty Bearcat Frequency Directory, and the 3rd edition South Florida Trunking Guide with this purchase. Anyway, email me direct mean18@hotmail.com with your offer.

Thanks,
Steve

I also got a $10 whip at RS for the scanner that works pretty well on the lower frequencies. I noticed though that for the 150-160MHz range you have to extent the bottom 4 seections instead of the top sections as the specs say.

I don't know your antenna, but thanks for the warning. :) I'm really starting to appreciate the standard duckie. Although I did notice something odd this morning with the Radio Shack cell phone antenna. It only receives well (at least as well as the standard duckie) when I bent it in certain angles. When I let the scanner sit for a couple of seconds the reception gets bad again because the antenna moves due to mechenical tension. This leads me to believe that my sample might be broken. So I guess I'll exchange it tomorrow and see what happens.

I'll keep you posted!

I have a cellular capable scanner but I would want to take it when we travel in USA.

Is there a way to block the cellular temporarily that would be legal if I were ever stoppped with the radio?

With the millions of cellular capable scanners that are already here in the
USA, it is still legal to own one, I don't think they are going to target you.
If you are worried when coming into the country then I suggest taking the
batteries out of the unit until you are clear of customs or the border.

All,

I'm happy to report that the Uniden BC3000XLT I purchased from Mr. Brock arrived today, and to his credit, the radio is in excellent condition with all the original documents and packaging materials.
While it appears now that it was not Mr. Brock's intent to perpetrate a fraud, in my mind this does not fully excuse the fact he failed to ship the radio on March 9, as agreed; that he lied to me on March 13, when he said the radio had been shipped; that he either changed his mind about selling, or lied again when he said he was returning my money order on March 14; and finally that he delayed shipment until March 17 without notification or explanation.
In any event, I did receive the radio today, hopefully putting an end to this issue.

You don't need to go inside. You need to isolate the two audio wise. I have the same problem mobile connecting to a amplified speaker. Get an audio isolation transformer and make a patch cable to go between the two units. I used Radio Shack # 273-1374 with a 1:1 turns ratio.

It is not illegal to own an un-blocked scanner. However, it is illegal in many states in the U.S., to have one operational, in your car. Michigan, where I live, being one state that does not allow it. The best way to transport, is with the batteries removed, and the whole thing out of reach from the driver, i.e.; trunk, or locked glove box, etc.

As a police officer in the United States, I can assure you that I and the hundreds of thousands of other police officers have much better things to be doing while on duty than looking for cellular capable scanners. Unless I stop you and you are tape recording, or scanning ESN's, 99.9% of us could care less. And probably 70% of all police officers aren't even radio "literate", so your chances of a problem are even slimmer.

This is a fairly new unit from AOR it is a self contained unit and needs no computer interface but you can if you want to. It has a small LCD display with scrolling arrows. It directly connects to the speaker output jack or discriminator output of your radio. Universal radio sells it new for $399.95 plus shipping.
http://www.universal-radio.com/catalog/decoders/3763.html

I will sell mine for $250 including Fed Ex 2 day COD. The manual is currently missing but I have one on order from AOR America and will include it if it comes by time of sale or mail it at no cost if it arrives later.

Looks and works like new.

Does anyone know what the "AMPS" mod would be for a BC220xlt?
While browsing the Bandercom site today they have a radio for sale that is a mod'ed BC220xlt to pick up cellular.

This is the link to the page:
http://bander.com/export/uniden.htm

This is the quote from the ad.
"The AMPS modified model allows 30kHz searching in the 800 MHz cellular bands"

I have a BC220xlt here as my "spare" radio (I got my IC-R2 a few days ago) and would like to know more on this mod.

Thanks for any help.

For the record, Glenn's recitation of the facts is essentially right on target. Al did get pretty tough while hiding behind a keyboard. He made some specific threats of personal violence which w ere taken enough to be reported to the Renton (not Bellevue, as I recall) PD who did evidence an interest, but who may not have contacted and warned Al about the seriousness of his threats. I know there was some discussion of a possible referral to ATF on May. He was (or claimed to be) a firearms dealer.

Furthermore, at around the same time AL mays' erstwhile ally, Mackey, was heard on a local Puget Sound are a repeater making threats and using obscene language in reference to local hams with whom he had disagreements over the Internet. He was up there on a visit from Portland at the time (a not infrequent occurrence in those days). The incidents were documented and, if I could recall the name and call of the one ham who was offended (though not a target of John's) who made of tape of a portion of his antics. There was some talk of sending it to the FCC, but I don't think that ever happened. As I recall (it has been several years), however, it may well have been either offered or actually provided to the Renton PD as a support of the complaint in the Al May issue (above).

I can't beleive that Al and John wnat to dredge all that stuff up once more. It wasn't exactly their finest hour.

Uhm, John,

I hope you feel like an idiot when the radio gets there tomorrow, or at the latest, Monday.

I have been buying and selling things through the net for about 3 years now, and I can tell you that the US Mail does *not* always arrive on time, even *priority mail*. I have had items make their destination in 2 days, and I have had others take a week or more.

The radio was sent out at 12:30 in the afternoon on Wednesday.

I am in Maryland... you are in Florida... it could take a few days!

Please be a little more patient... and have a nice day.

I've written 3 ActiveX DLL's + a basic control program for the PCR1000 that uses them. The program allows you to see what goes back and forth thru the serial port. It is VERY basic but the intention is to help others who may want to write some code as well. It's not an example of how to write code or how a web page should be set-up so please, only constructive criticism.

The program + all source code for the DLL's and the program are on my webpage http://www.campbell84.freeserve.co.uk

Please note that the code was written using VB6 + any wizard I could find.
It is 32 bit and only tested on Win98.
It's released as GNU software so it's free as long as your code utilising it is free as well :)
Remeber to backup your eprom before use.

Adam,

If and when the radio (or a refund) arrives I will be more than happy to post a notice saying so here on rec.radio.scanner and everywhere else I've discussed this issue.
The fact remains, however, that you did lie to me once, when you first told me the radio had been shipped, then said it was no longer for sale.
You also promised to ship the radio this Tuesday, and now by your own admission it wasn't shipped until Wednesday. A simple note from you letting me know of the delay would have been nice.
Finally, as for delivery times, on the same day I sent you the money order I also shipped a Pro-60 to another person living near you. The Pro-60 arrived there three days later and his check arrived here in three days.

There are no easy mods for 800 MHz since this radio does NOT receive in that range.

Best bet is to buy a scanner that receives in that range (or can be modified to receive in that range) and set it next to your Pro-2021.

I believe that any voicecommunication can be monitored. Even if the digital revolution cuts us scanner folks out of the analog game, I guarantee there will be some digtial evesdropping gadgetry made. After all, if the intended party can hear it, it's got to be monitorable, even if it's at a higher price. Any of you older listeners remember the price of an original 8-channel Electra Bearcat scanner? The black and white one?

Source record: 124665

I found that the supplied rubber duck antenna did a decent job on the HF broadcast band. I even disconnected the antenna a few times and still heard a very low but audiable signal. By connecting a 5-10 foot length of wire I found the HF performance greatly improved broadcast performance. The s meter moved a good amount with this antenna.
Does anyone else have ideas or tips on the AR 8200 performance?

They have a similar device, that uses your stock antenna, and mounts it to the glass (inside), via two suction cups!

Disadvantages; Slight signal loss

Advantages; Nothing outside, to draw attention. No wind/water leaks around the channel bracket.

Bill Crocker

The only way you'll get the channel and bank lockouts to work
properly will be to reset the processor every time you switch
your EEPROM "banks", and that will slow things down considerably.

Unless you intend to decode the EEPROM serial command/addressing
stream, the best you'll be able to do will be periodic automated
switching of your four "banks". The switching times won't bear
any useful relationship to the number of active channels in each
"bank".

As far as room goes, there's plenty for this simple
timer/counter/reset circuit.

>Can anyone help with a mod to turn off the LCD light on a pro 2042
>

There are 3 connectors going to the logic board...a 12 pin connector, a 11 pin connector and a 15 pin connector. Pin #10 of the 12 pin connector provides 8 volts through resistors R515, R516 and R517 (220 ohms) then each of the outputs from the resistors goes through 3 of the LEDs before going to ground. Here are some possibilities that you have:

(1)You would have to place a switch to interrupt three traces that lead to the 9 LEDs that provide backlighting for the Pro-2042.

(2) You could do some micro surgery and cut the traces before the resistors also or put a switch in to control pin #10 (8v) and jumper 8v to a cut trace leading to resistors R527 and R528.

(3) Another possibility is to cut the traces from the LEDs to ground. To do this, you would have to remove the LCD panel to do the cutting of the traces and soldering in the switch.

Too bad that pin #10 (8v) doesn't just feed the LEDs. This would make the mod all too simple.

Cross-posted to: rec.radio.scanner,alt.radio.scanner

Hi,

I got a cell antenna + TNC to BNC adapter yesterday for my bc235xlt. I'm very disappointed in the performance of this antenna. It's much worse than the rubber duck that came with the scanner. Heck, it's even worse than a cut off paperclip (I'm not kidding.). Of course I only tested the 800MHz. range. Even just the TNC to BNC adapter performs just as good.

Does anyone else has a similar experience or does anyone have a suggestion?

Thanks!

I have the following Radio, and electronic equipment for sale. Will consider trades for computer EQ. All working last time tested unless noted.Shipping is extra.
Thanks

Tempo-1: Tube type Ham Transceive with Power Supply.Covers 80-10 meters. Looks good and works well. $200

Pearce Simpson: Guardian 23- All tube CB Transceiver/with mobil power cord and mounting bracket. Looks and works Good. $100

Lafayette: HB444/25A Looks and works great. This is an all tube 25 channel base unit with a nice chrome trim all around. would rate an 8 in looks. I think the mobil mounting bracket is also included, with nice heavy cast alum mic. $125

Channel Master: Tube Stereo Receiver (Model 6612) and matching amp (Model 6601) Looks good and plays on FM only. AM not working. $125

HW-32: 20 mtr single band xcvr,mbl mounting bracket, and HW-13A mbl power supply with connecting power cord. Will also work with the Heath AC power supply. looks good works well on AC power have not tried it mobil, $125

Non Tube Items:

AR Inc: Stereo Amp, All solid state. $100

Traynor: Group Two B- Audio Amp Head. High/ Low mic. in puts. Master volume, volume, bass, treble and tone shaper controls. All solid state $125

Swan 14X DC Power Supply Module: No way to test but was told it was working OK. As is $50.

Swan Phone patch: with hook up cords. This unit looks real good, but is also untested. As is$35.

MFJ Antenna Tuner 941B rated at 300 Watts.Looks good and works well. $40

Siltronix Model 90-6 VFO: Excellent condition with three position crystal switch $75.

PRO 2003 Scanner: Radio Shack 50 channel(30-512 Mhz.) digital Scanner with FM broadcast band included. Have two, one is working the other is a complete non working unit. $200 for both.

Bearcat 250 Scanner: Have two. One working and one for parts. $75 for both.

Bearcat 210XL and 220 Scanner: One of each complete, but not working. $25 each.

Kenwood MC 50 Mic: Works OK and comes complete with cable and input jack. $50

When tuned to frequencies above 870 Mhz,
my PRO-51 receives clearly, however
a PRO-2050 trunktracker and a PRO-2022
scanner tuned to the same frequency are silent.
What gives?
All scanners share the same antenna and are
all about equal in sensitivity in that freq. range,
2 microvolts more or less.

********* "RARSfest 99" *********

THE RALEIGH HAMFEST
and COMPUTER FAIR

SUNDAY, APRIL 11

NORTH CAROLINA STATE FAIRGROUNDS, RALEIGH

3000 attended last year! Giant, indoor flea market, plus plenty of
dealer and manufacturer booths, contests, meetings and forums, prizes,
VE Exams, and the famous "Saturday Night Social." Special demonstration
of HDTV (High Definition Digital Television) by WRAL-TV!

PRIZES: GRAND PRIZE: Icom 706 MKII HF/VHF
5 HOURLY PRIZES: Icom 207H Dual-Band Mobiles -
One Each Hour, 10 till 2 PM.
Pre-Registration: $125 CASH!
(winners do not have to be present)

Location: North Carolina State Fairgrounds, Jim Graham Building.
Follow the Interstate 440 Beltline around Raleigh, to
exit 3 - Hillsboro St., and go west one mile to the
Fairgrounds. The Jim Graham building is at the
Southwest corner of the fairgrounds, just off
Hillsboro St.

Date/Time: SUNDAY, April 11, 1999, 8 am to 4 pm.
Building opens at noon Saturday and 6 am Sunday for
dealer/vendor setup.

Admission: Pre-register: $5 (before April 2nd). Gate: $6.

Flea Market: Table/2 chairs: $10
(5 or more tables: $9 each).
120 Volt AC: $15 per connection.
Drive-In unloading/loading. Bring your own
extension cords and carts.

Parking: FREE on site!

Talk-In: 146.64 (147.15 is the backup)

VE Exams: Given in the Holshouser building on the Fairgrounds.
Walk-in registration and testing begin promptly at 11 a.m.
You must show a picture ID to register. Exams are $6.45.
Contact: Charlie W4VFJ, 919-556-8551 (exam information
only please) email: w4vfj@aol.com.

Meetings: ARRL Forum with Roanoke Division staff, Army and Navy MARS,

NTS, ARES, APRS and QRP forums. Times will be announced at
the Hamfest. No DXCC QSL card checking this year.

Mobile, Cash Prizes for Homebrew, Mobile HF and VHF Installation,
Homebrew, QLF (left foot) and QBH (Both Hips).
QLF/QBH Contact: Rick KA3PSK, 919-870-8268.
Contests

General The NC State Fairgrounds hosts a permanent, general-
Flea- merchandise flea-market just outside the hamfest building.
Market: Admission to that flea-market is FREE!

Family Come make it a family event! Other activities available in
Activities: the area include the Fairgrounds Flea Market (free) and
Azalea Sale. A short drive offers Crabtree Valley Mall,
Blue Ridge Cinemas and NC Museum of Art.

Address: For tickets, tables, etc., make checks payable to
"RARSfest." Include your name, call, address,
and S.A.S.E !! Mail to:

Wilbur Goss
4425 Watkins Rd.
Raleigh, NC 27616

Requests received after April 2nd, or without S.A.S.E.,
will be held at the flea-market vendor door on the west
side of the building.

No but if anyone is thinking of buying the OPTOCOM Buyer Beware!!!

It includes software from SCANSTAR or TRAKSTAR. Its full of bugs.
Wait until somone else comes out with better software before you buy.

Optoelectronics included a basic MOS-DOS type program to do some basic
functions.

Ever heard of anyone still using MS-DOS?

Save your money for a few months and see what else comes out.

What about New York, where the possession of such a radio is illegal in a motor vehicle?

In any case I believe, transmitting over a police frequency you're not licensed for is clearly illegal, under Federal (civil penalty) law and NYS (misdemeanor, class B - e.g. 6 mos. in jail).

Ever see the ads that will let you crack your DSS satelite cards for only $39.95?

What they don't tell you is how much the programmer that you need to put the card into and hook to you r computer will cost!

Or if you can even get one!

It's like the cellular phone scam all over again. You need special equiptment to program these cards and I'll bet it's not available or cheap.

Ancient telegraphy/radio telegraph signoff meaning "Best Regards."
A variation sometimes used by or to female operators is "88"
for "love and kisses". Subject of endless discussion on-air and in
radio newsgroups as to whether "73" or "73's" is proper radio "grammar".
The terms, used by Amateur Radio ops early in ham radio existence, were
later adopted by CBers and others, who also spawned "Threes'n'Eights" and
"Good Numbers" as signoffs. Have also heard "72" and "75" but haven't
gotten translations for those.

>I have a BC220xlt here as my "spare" radio (I got my IC-R2 a few days
>ago) and would like to know more on this mod.

This is not actually a mod but a model. What we are talking about is several different models of the same scanner. There is the BC220xlt, the UBC220xlt with 12.5kHz steps in the cellular bands, the UBC220xlt with programmed steps of 30kHx in the cellular bands and for added clarifications there is the BC230xlt which is a BC220xlt that was sold with an extra battery pack.

Both of the UBC models were designed and marketed for sale outside of the United States. The BC220xlt and 230xlt were for sale in the states. The Javiation website gives the option of 12.5 or 30 kHz steps with the UBC model. http://www.javiation.co.uk/220xlt.html. There is a major difference in frequency coverage between the UBC and the BC models. Yes the UBC doesn't have gaps in the cellular bands but the BC220xlt, it covers 29-54, 108-174, 406-512, 806-956MHz(less cellular). If you note the specs on the UBC, it covers 66.00 - 88.00MHz, 108.00 - 174.00MHz, 406.00 - 512.00MHz, 806.00 - 950.00MHz (30kHz step sizes available if requested). Hope this helps.

Wiggie

Blake, as long as you stalk your certian usenet group trying to cause trouble & harass, I will follow the amateur radio code of self policing by peer pressure. The other newsgroups you frequent will be aware of your unwanted & harassing actions here. Hopefully, peer pressure will cause you to act appropriately in the future.

>Ever heard of anyone still using MS-DOS?

I have several MS-DOS computers that I use for scanning and radio applications

trunker
etrunker
pocflex
jvfax
hamcomm
ARES pac
mdtw1234
xmit id
mdt

all of these applications run in MS-DOS only and work very well. In some cases there is no Windows equivalent.

In regards to the Optocom...you are right, the software there does leave something to be desired, however there is a free update available and when installed it works much better. The Optocom is a very useful tool and worth the price if you want a scanner for LTR, Mot, and GE trunking systems. Its logging tools are very powerful and are great a collecting data about a system when your radio is unattended.

Your warning of buyer beware is a little strong. There are some problems, but the Optocom can be a valuable asset to your radio setup.

I use an 800 mhz element, on an nmo mount . This involves drilling a 3/4 inch hole in the roof,or cutting a rectangular hole with a dremmel tool. I find it works adequate on 2m and 70 cm and great on 800.

Remember: every adaptor you use is at least a 3db loss.

I agree with R. Clark's assessment. The Optocom is very useful. I'm trunking a local 400 MHz federal system, for instance. The Optocom makes it easy.

The TrakkStar software update does make a considerable difference.

As far as I'm concerned, its the best $459 I ever spent, I love my Optocom and recommend it highly. You swap entire trunking systems in seconds and can scan conventional frequencies and trunking simultaneously, its very flexible.

The software issue is small potatoes in the big picture. This Optocom is one hot receiver, I hear things on it I never heard with other scanners, especially in the military air band.

Blake Bowers, once again you committed a lie & forgery on usenet
in your continued harassment of me. I stated in a message as follows:

>Blake, how sad that the only way you know to try to win an arguement
>is to forge posts & change words in qoutes. You are unable to argue
>based on honesty or reality.

So below is a message of you attempting to qoute me. But you change the
words from "you" to "I", thereby totally changing the meaning & direction of
the message. You have demonstrated you lack honesty & integrity that you
display in your regular & repeated harassment me mo in the internet & on
Fidonet.

YOU, BLAKE BOWERS, are a pimple on the face of amateur radio
& emergency service workers. You are pathetic.

> normal business hours.
>

Wrong again, this would violate the Police Officer's Bill Of Rights, not to mention your civil rights to due process. Citizen Complaints, Disciplinary actions, personal information and any other information that may lead to incriminate a police officer for criminal charges is not public. Performance reviews are strictly "opinionated" and are often based on supervisors personal feelings, therefore are not allowed to be made public. A local police officer was just awarded in excess of $100,000 when his municipality decided his recent citizen complaint and disciplinary actions should be made public. After he was cleared of wrong doing, he filed a federal lawsuit for violation of his constitutional rights under due process and violations of the Sunshine Act. His award was made by a jury and confirmed by a federal judge, the US Attorney's office then received a criminal complaint for the incident and is considering criminal charges now.

Maybe in Florida the law enforcement officers tolerate this illegal behavior, but in our state it is dealt with swiftly and severely. The municipality I work for is very conscious of police officers rights since they previously spent lots of money defending violations of these acts and laws. Once we hit them in the pocketbook very hard, they learned a very expensive lesson.

> normal business hours.
>

Wrong again, this would violate the Police Officer's Bill Of Rights, not to mention your civil rights to due process. Citizen Complaints, Disciplinary actions, personal information and any other information that may lead to incriminate a police officer for criminal charges is not public. Performance reviews are strictly "opinionated" and are often based on supervisors personal feelings, therefore are not allowed to be made public. A local police officer was just awarded in excess of $100,000 when his municipality decided his recent citizen complaint and disciplinary actions should be made public. After he was cleared of wrong doing, he filed a federal lawsuit for violation of his constitutional rights under due process and violations of the Sunshine Act. His award was made by a jury and confirmed by a federal judge, the US Attorney's office then received a criminal complaint for the incident and is considering criminal charges now.

Maybe in Florida the law enforcement officers tolerate this illegal behavior, but in our state it is dealt with swiftly and severely. The municipality I work for is very conscious of police officers rights since they previously spent lots of money defending violations of these acts and laws. Once we hit them in the pocketbook very hard, they learned a very expensive lesson.

At the time YOU were MAKING the accusation (1995) John Marcinko was the
owner AND licensee. His status NOW is irrelevant. Your logic is like
a policeman trying to give someone driving 65 MPH on an interstate because
the limit USED to be 55 MPH.

Ask and ye shall receive...lots o good stuff here...

North Island (NORIS) NAS (runways 11-29 and 18-36; helo pads 2-13):

283.0 NORIS ATIS
356.8 NORIS Clearance Delivery
352.4 NORIS Ground Control
336.4 NORIS Tower
285.2 SoCal Dep
381.5 SoCal Dep
291.7 L.A. Center
238.0 VS-41 Common
360.2 El Centro Tower
319.9 NORIS GCA
353.5 NORIS GCA
289.9 'Beaver' check-in
266.9 'Beaver' north check-out
272.6 'Beaver' west check-out
344.1 'Beaver' discrete
342.7 ASW Common
278.8 San Clemente Tower
363.1 SoCal Dep
281.5 'Misty' (VS-41) Base/Maintenance
322.0 heard 'Shooter' here once, but not enough for ID
271.4 Imperial Beach Tower (just south of NORIS/San Diego)
284.6 Imperial Beach/NORIS GCA
307.8 L.A. Center
355.5 NORIS Base Ops
265.1, 301.1 also heard...

Also, search 137-144mhz (FM) and 148-151mhz (FM) for maintenance dudes
on the airfield, base police, etc. The whole area (NORIS, Coronado
NAB, other military installations) has a big trunk system in the
137-144mhz range. 140.9, IIRC, is one of the airfield maintenance
freqs, confirming landing aircraft, etc. Also try the 137-144 in the
AM mode for plane-to-plane comms. A trunking system is also used in
the 406-420mhz band. Also, I think a few ships are working simplex
around 410-420mhz. Sporadic comms there, however...

A great place to monitor/observe acft is at the beach on the west side of Coronado Island. It's a beautiful beach, just along Ocean Blvd, with a great view of Pt. Loma and the sunsets. At this point you're right under the approach to runway 29, and you have a great view of many aircraft t/o and landing from/at the NAS in general. It's also pretty cool to go running during lunch on the beach with S-3's overhead coming in to land.

Tips to ID helos at North Island NAS:
1. When t/o or landing, helos will make a "channel approach" or a "channel departure", meaning the channel of water between the Island and PT. Loma (mainland, technically); also, a "bay approach" or "bay departure" can be made, meaning San Diego Bay (btwn the Island and San Diego). A map of the area is pretty useful actually.

2. Helos will refer to "Pad-#" (at NORIS, 2 thru 13). Right away you know it's a helo. Also will refer to the "auto area", for auto-rotation training.

3. When helos are in the bay making a bay approach, they will call out the "bay bridge" (bridge spanning the Bay btw San Diego and Coronado Island), then a few seconds later the "carrier pier" (just E of the helo pads).

NORIS also has a flying club on base. You'll hear this now and then, mostly Cessnas and other private acft.

Also, the US Coast Guard is always active on the VHF Maritime freqs, especially when it's foggy or the wx is poor. Channels 12, 13, and 16 were usually pretty active anyway. They go out and help guide boaters in through the fog. The fog can roll in pretty quick in the evening sometimes, watch out!

Callsigns at NORIS:

Misty VS-41 S-3B
Griffin VS-38 S-3B
Shadow VQ-5 ES-3A
Landslide .. CH-46
Shamrock .. H-60
Island Roller .. H-60
Battlecat .. H-60
Knife .. CH-53?
Calumet .. helo
Combat .. helo
Sword .. jet
Lonewolf .. helo
Hunter .. helo
Black Knight .. helo
Loosefoot .. helo
Saberhawk .. helo
Red Stinger .. helo

Now for Miramar...

Miramar MCAS (runways 6L-24R, 6R-24L, and 10-28 [carrier runway, restricted use]; helo pads 1-5 and 6-24 [LHD strip] *** Miramar South is the jets, Miramar North is the helos, 2 different sets of freqs):

Miramar South (jets):
280.4 ATIS
315.6 Tower
380.8 Ground Control
301.3 Clearance Delivery
306.7 PTD
269.1 SoCal App

Miramar North (helos):
358.15 ATIS
336.825 Ground Control
303.625 Tower

Good luck, hope you are able to hear lots of good stuff.

Jeff, KF4KWO
Virginia Beach, VA

>things to be doing while on duty than looking for cellular capable
>scanners. Unless I stop you and you are tape recording, or scanning
>ESN's, 99.9% of us could care less. And probably 70% of all police
>officers aren't even radio "literate", so your chances of a problem are
>even slimmer.>>>>

Piero,

Thanks so much for your input. As you have already said, with all the higher priority ciminal activity going on in todays world a person casually listening to a cellular conversation would not warrent a code 3 response.
I would assume most scanners are tuned to the police and fire frequencies anyway. Much more exciting ! It's almost like being there with you in the field (Almost but a lot safer). I too once had a badge pinned to my chest and that is why I still scan. I miss the blood pumping activities that I once was a part of. Hearing and following the action via my scanners is a way to kind of still be in the field. Now only in my arm chair with no light bar overhead.
Thanks again for your input. I'm sure this law, if it passes, will be aimed at high profile cases that will bring the lawyers a fist full of money.

i have 16 JPS 500 dsp noise reduction units, rack mount that have been
taken out of service. they are
very clean, all are tested and ready to ship with manual.

they feature selectable processing/noise reduction levels. will remove
white noise, cw rtty etc.
they have voice detection processing for syballic squelch.

this is professional equip, not amateur.

$300.00 each with free shipping ups ground.

Bwahahahahahahahahaha!!

You now say you can't "recall"!!!!!!!

For the record, the repeater owner & licensee of the repeater in question
AT the time in question (W7FHZ) was VERY surprised when I told him of
the bloated & non-factual accusations when they occurred. He checked it out
at the time & found there to be NOTHING that was in-appropriate. I might
add that I share a repeater freq with him (53.29 Mhz) & had an
adjacent table to him at the Puyallup ham swap meet last weekend.
(we were both swap meet exhibitors) He has NEVER brought up this
situation since our initial discussion (& LAUGHS!) at the time of the
original surfacing of this made up story a few years ago.

SNIP

Just because they tell you so doesn't make it true. While it is clearly illegal for you to transmit on police frequencies merely owning the radio would not be a violation unless there is a local town ordinance or such. Ask them for the legal citation (the statute number) of such an ordinance.

Hello..,

My friend just gave me a Realistic PRO-2009 scanner...and I was
looking around on the web,and noticed that there doesn't seem to be much
info on this scanner..

I am really interested in Mods..and a schematic..
the scanner only covers from 30-50Mhz, 144-174mhz 410-512mhz.. and I
havn't been able to find any local signals as of yet..
are there any mods for wider coverage,or more memory.?? anything is
apreciated..

Thanks..,Pat Taylor..

Looking to trade one of my scanners for a CCRadio. Your choice:

Radio Shack PRO-2041 400 channel computer programmable (upload only)
PRO-2050 300 channel Trunk Tracker

Both scanners come with original box and accessories and are in excellent condition. CCRadio should also be in excellent condition and with original box and accessories. If interested, e-mail directly. Thanks.

Allen

Hey Pat, I too own a Pro-2009. Have you been able to fill the all memories yet? :-)

I haven't seem much of any info on this radio either. I use it for the local (Tacoma,WA) police department. They are still on 460 in the open and 8 channels gets most of the important freqs. I'll pass on anything I find though.

Hummm,

Sounds like Ohio's carrying a firearm law.....remove bullets and transport in glove box, firearm transported in trunk....maybe MI might issue a carrying a concealed scanner (CCS) permit.

Maybe scanner users should form the National Scanner Association (NSA), to lobby for a CCS permit. Then lobby for an admendment to Telecom Act where one for a price (say $1000.00) one could obtain a Class Unblocked Scanner License (just like the machine gun ATF law). Instead of getting permission from the Chief Law Enforcement Officer, one would have to pay off their local PCS and Cellular carriers. This would be a "win-win" situation for all, all authorities make a buck and the scanner user gets their cell frequencies back.

Just a silly food for thought :)

Ivan Ivanovich

Sorry, but your understanding is wrong. There is no prohibition in the law for possession of a cellular capable scanner. It will be illegal to modify a scanner to receive cellular or other protected communications but it would be very difficult to prove who performed the mod unless they caught you in the act.
It may also technically be illegal to sell a cellular capable scanner that you already own, although I can't see the FCC and FBI stalking the flea markets and ham fests looking to bust individuals. Dealers, however, may have a problem. Universal Radio, for example, will not accept as a trade-in any cellular capable scanner.
I say it "may" be illegal since it will depend upon how the law is interpreted.
It will be illegal to sell receivers "primarily" useful for monitoring protected communications. Since the cellular band is only 30MHz of the 1gHz or so that most scanners cover I can't see them being ruled as "primarily" intended for use in monitoring protected communications.

Same as above, you can keep it, but technically it may be illegal to sell it, depending upon the interpretation of the law.

Hi! My experience in monitoring Mercy air flights - I concur with Bud. I've never heard any dispatching of Mercy air by their base.
They do have considerable communications abilities with many public safety agencies and contact whomever is requesting them on the appropriate tactical frequency. Keep in mind, the public may NOT call air rescue; their response is ALWAYS by a law enforcement/lifeguard/fire safety services unit because of expense - it costs approx. $3,500.00 for a simple response!
Their hospital communications are on the appropriate trunked system - either the City or RCS if responding to a county incident.

The software has been updated 4 times in the last month The users are the beta testers.

It should never have been shipped out with buggy software. Gives Optoelectronics a bad name.

Granted there is nothing really better then it BUT its still no excuse to do this to its customers.

I agree with most of your points BUT

How about the Signal Strength readings? Its a hardware problem.
How about not being able to tell the difference between even and odd talk groups?

I just don't think it was ready to be put on the market.

I love it anyways. I want a second one maybe a third but I don't dare buy it until the bugs, hardware and software are worked out.

It would have been nice if there was some better written material and a half decent box. It would also have been nice to know that in stand alone mode it does not decode pl/dpl etc. and let not forget how bad it performs on busy systems. It does not even pickup 40% of what it should.

4582. Saint Louis emergency landing on 03/19/99

Newsgroup: rec.radio.scanner
Date: 1999-03-21 00:00:00 UTC
From: Robert Emerson <k0zz@worldnet.att.net>
Message-ID: <7d3tst$pv0@bgtnsc01.worldnet.att.net>
Source record: 124540

Hi, wonder if anyone monitored the emergency landing Lambert for US Airways flight 5808 on Friday March 19, 1999 at around 3:00 PM Central Time. I was on that flight and they made us do all of the procedures for an expected crash landing but nothing happened and we scooted right over to the terminal. Have watched the news and looked through the Post Dispatch not finding any mention of it.

Thanks, Rob

4585. Outragious pricing of PRO-2004/5/6 Scanners!

Newsgroup: rec.radio.scanner

Hello Everyone,

I thought I'd throw my two cents in about the recent observance of ridiculous pricing of the PRO-2004/5/6 scanners. I have been seeing used versions of these scanners actually going for double to triple their closeout price from Radio Shack. I've actually seen prices going for $250 to $400 on the newsgroups. Commtel distributes a PRO-2006 "clone" which I have seen selling new for around $300 shipped! I guess the guys selling the used RS scanners can't be faulted since there are people actually buying these used scanners at these ridiculous prices. WAKE UP PEOPLE!!! You could be buying a brand new "clone" with cellular capabilities and all for around $300 shipped to your door. Just my two cents worth....

Dan,
You are a liar just like your buddy Glenn.
I have never threatened anyone.

The only thing I said was that I wanted an eyeball with you and Glenn. You are supposed to be a Ham.....then you should know what an eyeball is. An eyeball is Ham talk not CB talk so maybe you do not know what an eyeball is.

If you think an eyeball is a threat then you must have been doing something terribly wrong to consider an eyeball a threat.

The Renton police Dept. has never contacted me about anything. If you called them they probably wrote it off as another nut case telephone call. I seriously don't believe you called as you would not have wasted the quarter.

I have never been a firearms dealer and have never claimed to be.

The only ones dredging this up is Glenn and Dan I guess they are proud of their finest hour. Har Har. In case you do not know what Har Har is.....it is laughter it is not a threat. But if you think it is please call:

Renton Police - 425-235-2600

Bellevue Police - 425-455-6917

King County Police - 1-800-344-4080 (This one is freebee Dan you don't have to
spend a quarter)

Washington State Patrol - 206-439-3834

If you want the number for the FBI, ATF or the CIA, look them up yourself.

> SNIP
>
> More lies of intimidation from Glen. ... yadda, yadda, yadda (More Mackey
> effluvia)

For the record, Glenn's recitation of the facts is essentially
right on target. Al did get pretty tough while hiding behind a keyboard. He
made some specific threats of personal violence which w ere taken enough to
be
reported to the Renton (not Bellevue, as I recall) PD who did evidence an
interest, but who may not have contacted and warned Al about the seriousness
of his threats. I know there was some discussion of a possible referral to
ATF
on May. He was (or claimed to be) a firearms dealer.

Furthermore, at around the same time AL mays' erstwhile ally,
Mackey,
was heard on a local Puget Sound are a repeater making threats and using
obscene language in reference to local hams with whom he had disagreements
over the Internet. He was up there on a visit from Portland at the time (a
not
infrequent occurrence in those days). The incidents were documented and, if
I
could recall the name and call of the one ham who was offended (though not a
target of John's) who made of tape of a portion of his antics. There was
some
talk of sending it to the FCC, but I don't think that ever happened. As I
recall (it has been several years), however, it may well have been either
offered or actually provided to the Renton PD as a support of the complaint
in
the Al May issue (above).

I can't beleive that Al and John wnat to dredge all that stuff up
once
more. It wasn't exactly their finest hour.

Hi, Robert!

Not a stupid question at all; I asked it myself about a year ago, before I "took my test".

The term "73" is used as "Best Regards". It was first used in CW (Morse code), as it was an easily identifiable kind ending to a conversation.

Message-ID: <7d4dvu$i4d$1@camel18.mindspring.com>
Source record: 124552

Has anyone ever gotten a 4 level decoder to actually decode all 4 flex levels?

I built two different decoders (different schematics), and get the same results, meaning I can still see only the first 2 flex levels, plus get plenty of I/O errors (using pocflex), and lots of garbage at times.

Both decoders appear to function as they should, meaning there is plenty of different activity on DCD, DSR and CTS. I get the negative & positive peak voltages OK.

I built a filter stage for one of the decoders, and that helped with the garbage, but not the flex levels.

I get pretty solid copy with the two different 2 level decoders I built.

Thanks.

I believe 73 caught on and was made famous with the use of Morse code. At the end of an endless series of dah's and dit's, there was something musically familiar about the rhythm of the 73. I guess you'd have to be a real fellow radio geek to appreciate the melody of 73 in morse, but for those who do I think they would agree it has a nice sound! Just my 2cents and it may not even be worth that!).

Greetings,

There is a little thing here called supply and demand. As the demand goes up and the supply down the prices will continue to increase. Have you ordered one of these radios from overseas? It's not likely, but by ordering one of these illegal scanners from overseas you could be jeopardizing at the very least, the receipt of the radio, at the very most conviction and a rather hefty fine. Many people don't care to assume that risk. Just my thoughts, I could be wrong.

Hi ,
I want to use my scanner radio near my computer. I have a database with many frequencies in it. My computer puts out too much interference though, especially the monitor. I sometimes cut off my monitor and the radio springs to life. I am using an external antenna. The distance the radio is from my computer varies from 3 feet to 12 feet. I would like to have it close enough to read the display. Any help would be appreciated.

thanks

Ohh and while i am on the subject...

Does anyone have,or know where i could get a schematic for this *cough* fine piece of equip..??
(actually it isn't too bad,I just wish i could find some mods for it..And for free..hey!)

Is it even possible to mod this scanner..?? I also have a REALLY old scanner that uses (hold your breath) Crystals!...(i think it was made in..'74,'75?) The only prob is....I can't find crystals anywhere..

Some of them, as others said, work on 895 MHz. But the 454 MHz system is still on the air (personally verified by me this weekend!). The channel allocations are widely distributed and also well detailed in 47 CFR: air-to-ground on 454, ground-to-air on 459 MHz.

From: John Lochey <jlochey@idesign.com>
Message-ID: <7d5sm8$23j$1@client2.news.psi.net>
Source record: 124336

R2 Owners,

I'm thinking of buying the R2, could I get some feedback from some owners of this radio? From what I hear this radio is awesome! I would be using it as a VHF/UHF scanner primarily, how does it perform there compared to other Bearcat scanners, etc? There is no keypad, is this a hinderance? How is the PC programming software? I don't really see how you could function without it. Can you use all of the radios features without connecting it to the PC?

Any and all feedback is greatly appreciated...

John Lochey

I suggest that you wire an antenna to your monitor and transmit your interference all over your neighborhood. Eventually someone will complain to the FCC and maybe they will start to enforce rules that require manufactures to properly build monitors.

Jumping in where I shouldn't, I have a '2004. I like it very much.
My new PCR1000 is nice. But there are times, like when I am in the car,
or at lunch, or the power just went out, when the 2004 is more
convenient than the 1000. And if some one wanted to buy it, it would at
least cost them $400, and I would most likely turn that down. Now $500
or more might really get my attention.
There are many examples of "objects" increasing in value after they are
no longer made. Like pre-ban high capacity "magazines" for handguns.
"Things" tend to be sold for their "perceived" value. I would not buy a
pre ban magazine at any price. I have no use for one. {I have no
pistols}. But, if someone wanted one, and they are not being made
anymore [slightly more complicated, because while they are still being
made, they just cann't be sold to normal civilians], then the price will
go up. Do you honestly think that diamonds are all that rare? There
is an artificial vreated "shortage" to keep the value up. When the
new South African givernment started making noise about nationalizing
the diamond mines. the diamond merchants threated to flood the market.
Or jsut look at the "antique" market. Do you really think a "chipndale"
chair is relly worth those big bucks? But there are not many of the
originals left around these days. Or how an artists paintings get a lot
more expensive after (s)he dies?.
Scarcity "creats" value.

I believe it is called capitalism.

While people may state that they would only sell there 2004 for $500, this is far from what the going rate for a scanner of that vintage with a membrane keypad would command.

Nonetheless, assets will be sold, at whatever ONE person is willing to pay for them. Not a group of people, or people whom can get similar products for less.

Having said that, I have seen over time, auction internet sites, driving-up the prices of some items.

You see quite a few posts here, pointing people to e-bay, and then you go over there, and see scanners, and audio equipment going for nearly new full retail mail-order prices, and just go on your way. If they can get those prices, so be it.

There are always going to be people whom also pay full retail from an automobile dealership, but that doesn't mean everybody does that.

communications electronics has them for $219.95. I can't get the damn software to work at all, which sucks, and the radio has a lot of bleedover/intermod interference. I have been told that there is a filter or modification that Relm has been doing for these to correct the problem, but I have also heard that the modification has either done nothing at all or has made things worse.

Great little unit, I especially like the dial method of selecting freqs. But I don't like the 'Func' button. The scanner has a small function button on the left which is extremely hard to press. I cant see any reason why they would not have made this button as large as the SQL button since it is used to do just about everything. So if you are particular about buttons and ease of use you may want to try before you buy. But the size and price are amazing for what it can do, and the audio is very good also.

ICQ me 8309550

The other night I came home late, and tried to unlock my house with my
car keys. I started the house up. So, I drove it around for a while. I
was speeding, and a cop pulled me over. He asked where I lived. I said,
'right here, officer'.

4635. Re: CTCSS

Newsgroup: rec.radio.scanner
Date: 1999-03-22 00:00:00 UTC
From: Alan <alankg@siscom.net>
Message-ID: <36f6cd71@news.siscom.net>
Source record: 124363

CTCSS, or more commonly refered to as tone squelch or PL, is a sub-audible tone that is sent during the entire time a radio is transmitting. The use is this allows multiple users of the same frequency, but each user only hears a transmission from another member of his group. It also keeps skip signals or possible intermod from driving a user nuts.
ROBERT GREEN <ranger42071@earthlink.net> wrote in message news:7d4cf5$kl2$1@ash.prod.itd.earthlink.net...
COULD SOMEONE PLEASE TELL ME WHAT THE HELL CTCSS IS AND WHAT IT IS USED FOR

Continuous Tone Coded Squelch System (CTCSS).
Let's a sub-audio tone open your squelch instead of just signal. Just a way to filter out signals you don't want to hear. Useful if there are two adjacent repeaters and you can hear them both. If they are using CTCSS, you can program the tone you are interested in and only listen to them. You will see your S meter move now and then without hearing anything -- that would be someone transmitting without the CTCSS tone you encoded. One way to tell if you have it enabled, is to turn your squelch all the way off -- normally you hear the roar of the ether -- with CTCSS on, you will hear nothing (until someone transmits with that tone).

cheers

4638. Re: Icom R2 questions...

Newsgroup: rec.radio.scanner
Date: 1999-03-22 00:00:00 UTC
From: dcisive@earthlink.net
Message-ID: <MPG.1160921baccc38659896dd@news.earthlink.net>
Source record: 124366

IMHO the R2 is the best thing that has yet come down the pike from Icom. It is much better than it's price would indicate. As far as I am concerned, it's only competition in the performance arena is the Yupiteru 7100-7200 as their superior sensitivity is what has given them the #1 spot in that area, and the R2 is the first scanner to give them competition. If you are good with the concept of programming, the R2 should not present much of a challenge. Of course without the keypad it may well take a few more quick steps to complete a program, but this is NO BIG DEAL. I have found no need for the software as I simply programmed in the local frequencies where I live and forget about it. It is one of the most delightful surprises in the banter of "me too" products. And by the way, Uniden products aren't even in this league. I own a AR8200 and no longer even use it as the R2 hears things the 8200 doesn't even know is there. Good luck.

ZaaX asked ...
> ...what frequencies Amtrak engineers use on the Pontiac MI to Chicago route?

When off their own territory, AMTRAK trains use the road frequencies of
the host railroads. The following may be a bit dated, but should be generally
correct.

Pontiac, MI - Detroit GTW 160.590 Ch 1, 160.530 Ch 2
Detroit - Kalamazoo Conrail 160.800
Kalamzoo - Porter, IN Amtrak 161.325 (160.800 ??)
Porter - Chicago, IL Conrail 160.800
Union Station, Chicago Amtrak 160.305

I use MDT Monitor with just the baseband audio going directly to the
line in on my Sound Blaster AWE 64. Works Great!! I "READ" the MDT
transmission to and from a near by Police department all the time.
It's pretty cool.
Remember though, MDT Monitor is capable of only decoding the Motorola
MDC-4800 MDT Protocol.

OH HELL! NOW YOU TELL ME!!!
I just got my (SL)OPTOCOM on friday and it took less than 2 hours to
learn all there is to know about quality control at
(SL)Optoelectronics. Software buggier than a manure pile in July and
the Hardware is pathetic.

Might be based on a good idea but actual product sucks.
Mine lasted less than 10 minuets before it went on a head trip. Failed
to lock in one mode or the other, all screen indicators flashing in
random order. Would reset the volume/squelch at any moment.

Wrote the author of Scanstar thinking it was the problem. At least he
replied within reasonable time.
Bummer is I like the concept, manual twiddle of the volume and squelch
or keyboard control selectable. Of course Scan Star has no provision
for this so you gotta keep the critter on the desk just like my
2006's. At least they stay locked.

The DOS software has no provision for scanning, wanna change freq,
enter it manually. Now there's progress.

A year or so back I bought a Tech Toyz tone decoder. Shoulda learned
that time. It failed out of the box too. Seems they had some sloppy
soldering and assembly problems and it would short the battery out
when you put it in. spent 20 mins on line with a tech whilst he walked
me through the cleanup process. Still woulden't work reliably.
Sent it back.

Damn shame the way they are more interested in slamming junk out the door than selling a quality product. My Opt 3000 counter from '90 is rock steady to this day.

Obviously quality control Has hit the crapper in a hellbent rush to SELL SELL SELL.

BUMMER.

Really disappointed... LCM

Wander in to your local computer shop or failing that, a Rat Shack.
Obtain a tleast 2 line filters and place on at each end of the monitor
cable. You might could use one on the keyboard too.

Should solve the problem. I use my radios with the antenna about 4
feet from the computer and have few problems with noise. I do have a
VLMF Packard Bell monitor tho.

good signals... LCM

Blake, if "many people have seen it", then how come NO ONE
seems to know where to find it or can say WHERE it exists?

Mike, what scanner do you have? What brand and type of computer and monitor do you have? What type of cable to your antennae? My Pro 2045 sits 1 foot away from my Princeton EO17 with no problems. I use RG8-U-95 Foam cable. The cable has a lot to do with shielding interference. Try good cable if you don't have it yet.

Yes, a Realistic Pro 26 European version covers 25mhz to 1.3gig, no
gaps, 200 channels, real fast scan, and excellent performance. You
wouldn't be dissapointed. You can buy them from Several dealers in
Canada or the United Kingdom. Javiation in England will give you the
best price with the best service.

Hey Gang,

EL Backlight on my PRO-2004 is shot. The inverter circuit checks out fine.
Radio Shack National Parts does not stock a replacement EL for the PRO-2004.
Anyone out there know of an after market EL that I can use to replace the shot one or maybe one from another model Radio Shack scanner that can be used in the PRO-2004?

Thanks,

Tony/N4DFM

4665. Re: ar2500 - tr4500

Newsgroup: rec.radio.scanner
Date: 1999-03-22 00:00:00 UTC
From: Gerald Taylor <getaylor@telepath.com>
Message-ID: <36F61124.EFE92559@telepath.com>
Source record: 124409
Body handling: Binary attachment payload not displayed: getaylor.vcf

I purchased one of the ACE COMMUNICATIONS TR4500 (AR2500) radios in 1995 for nom. $450. They, at my request, sent me a next to impossible to read schematic along with the usual users' manual. The radio generally performed very well until about three years ago when it developed a problem with the power supply. Then the "fun" started.

After several unanswered email to ACE, I placed a long distance call and, after being on hold for >15 min., the person who answered said that the technician was out and took my name and number and assured that the tech would return my call. One month later, no return call being received, I again placed a long distance call and did more time on hold. Finally, a man answered and after telling him my desire to get help , he said that I needed to talk to the tech who was on another line, back on hold. The second on hold period ended when I was disconnected. Subsequent calls and e-mail went unanswered.

Next try to get assistance was through AOR EDCO, USA and through an English company who sells AOR big time. Multiple efforts on my part resulted on NO RESPONSES.

Finally, AOR(Japan) decides that EDCO will no longer be their rep in the US and sets up their own operation for AOR(US) in California. Now I get help???? WRONG!!!! An e-mail to AOR(US) wherein I simply asked for a good schematic and source for an IC (NEC) which I could not cross or even get from any NEC dealers in the USA, including NEC USA received one response from AOR (USA). Guess what? Their position was simply that do not provide any support for the radio. No help, no advice, no send it to us and let us help.

I painstakingly deciphered / constructed a working schematic from the radio in conjunction with the hand sketched one from ACE and used my various cross references, books, skills, etc. to define a workable substitute for the failed NEC part. The radio now works.

I have been unable to find out the details, but rough information gathered indicates that there was some problem with the importation of these radios and that is the reason they are worse than the plague to AOR/ACE. I have no proof of any illegal activities, only a certain "hands off " response from both parties regarding their products.

My advice to you?? I , personally speaking, have no desire to do any other business with either of these companies. If you purchase the radio, be aware that getting it repaired may be difficult at best, if at all. Schematics, of any quality, are evidently non-existent and some of the parts are true collectors items (rare). IF the radio is currently

working and a good opened (guts) inspection looks good, then you might consider the purchase at a VERY LOW price <$150. There are several new wide band receivers on the market for <$500, especially handhelds. The only advantage the AR2500 gives is the cell phone bands and monitoring them is illegal. Besides all that , they're probably boring as hell.

I hope this gives you some help.

Your problem is someone running a cb (basestion) with a lot of power near you or posibly next door . Look for a big tower ant. near you ,it is posibly the source of interference. Then let him know your problem so he can correct it .

So you'll be returning yours?

I have to agree that the software seriously needs a good manual. I can think of 2 dozen good questions that should be addressed. The help file is rich but there are still many things lacking explanation. And while the author was very quick to respond to my questions, even offered for me to send my SWG file and he tested it, there doesn't seem to be any explanation to my radio going deaf and then mysteriously coming alive when you do something quirky like switching views a few times or reloading the SWG file. Software hasn't bombed though, I can only hope that the software gets better (more predictable). Otherwise it's trunker and the Optocomm becomes a 2042 with an OS535 installed.

Art,

You might not have enough gain in your circut. Try adding a gain stage with
a simple pot fine tune.

Also, make sure you are powering the interface with an external power
supply. It is important since some computers can't supply the necessary
voltage for this circut to work properly from the serial port.

Good luck!
-Lb

Remember: every adaptor you use is at least a 3db loss.
We have to stop this wive's tale about adaptors. There is no measurable loss in a one inch solid metal 100% shielded adaptor, let alone a whopping 3 Db!!! I believe it was Monitoring Times about a year or so ago that did a test across the scanner freq. spectrum by "piggy-backing" a dozen adaptors on top of each other (BNC TO PL-259 TO TNC TO MOTOROLA TO ....) and with real test equipment still found no "real" measurable loss.(point zero zero zero of a DB or something) there is probably more loss in a 6 inch piece of quality 95% shield coax, which also would have no measurable effect on a scanner signal.

Due to an increase in cellphone related crashes caused by driver
inattention, many states are proposing laws prohibiting using a
cellphone while driving. In other words, if you want to make or receive
a phone call, you're going to have to pull over first.

You're right. You can get a new Comtel 205 which is a 2006 clone for $330. I just bought a 2005 from a scanner store for $180 and this guy is known to be tight with his money.

Ace was always a real pain to deal with. I suffered through everything from receiving someone else's return as a new radio to
being charged $65.00 to have the reset button pushed on my AR3000. Anyway...I have owned many AR2500s and it was in my opinion
a GREAT CONCEPT with terrible design. It seems they built this radio with about $5.00 worth of parts. From the dim display, to
shielding that consisted of tin foil and electrical tape it is a love hate relationship at best. I wish AOR would go back and
re-work their design now that they are producing true quality products because the AR2500 had about all you could want in a
scanner and at the time, was pretty revolutionary in concept. But with the computer controlled radios that are available now,
I would not waste my time and money on an Ar2500 unless it was dirt cheap.

4680. Re: Alinco DJ-X10 software?

Newsgroup: rec.radio.scanner
Date: 1999-03-22 00:00:00 UTC
From: mjgilbert@wcom.net
Message-ID: <36f65a21.3440747@news.compuserve.com>
Source record: 124424

Bruce:

I have a windows based program the controls the Yaesu FT-990 and
the Icom 706, I tried to add the DX10 - I have figured out how to set
both VFO's from my program but I can't figure out how to do it without
the radio supplying an annoying reset at the end of the command
string.

Anyway, I would be happy with just a method to set the VFO's in
real-time. I'm not interested in 'computer-controlled scanning' just
computer control. A volume control would be nice too but I don't
think that's implemented at all in the command protocol.

Wanna keep it simple? If you're listening primarily from home, what I have used for many years with great success...rabbit ears from an old (once new) cable-ready TV. I knew they would be used for something someday.

Everyone seems to have a set of these somewhere in their house...if not they're cheap. Find/buy them, buy or find in your junk drawer whatever antenna jack you need for the radio. Take one wire from the TV antenna and put it to the center (or one side depending on the plug/jack) and the other wire to the other side or outside. Secure with solder or make certain it's secure with vinyl tape. This works very well. If you have a TV antenna on your house already, you could try that, but it will probably be "too good" and will pick-up planes so distant, that your scanner/receiver will lock-up and process noise, not a usable signal. For mobile use, you could try an aircraft accessory store (but be prepared to pay...how many thrifty pilots/aircraft owners are there really?) You could use a 2-meter (amateur radio band 144-148 Mhz) antenna. The whip portion should be lengthened a bit (3-5 inches approximately...this "lengthening can be obtained simply by not cutting the stock whip for a 2m antenna) but for receiving, length is not absolutely critical. You could also try a mobile scanner antenna. They are close enough in frequency to function well. For mobile use, all you really need is an antenna reasonably close to the airbands and outside your vehicle. Remember, FM broadcast radio is from 88 to 108Mhz. The airband starts at 118Mhz. Cant get much closer than that. You might want to try a cheap RadioShack car antenna splitter...one end to your car stereo, the other to the airband receiver and the other to the antenna.

I hope these ideas help a little.

4683. Re: Drag Racing Freqs needed

Newsgroup: rec.radio.scanner
Date: 1999-03-22 00:00:00 UTC
From: John Habbinga <habbinga@wt.net>
Message-ID: <7d5p4d$t84$1@sys14.hou.wt.net>
Source record: 124427

I went last year and had a whole lot of fun. More rednecks per square acre
than anywhere else. The best frequencies to monitor are:
NHRA
Ch 1 - 461.075 - Officials
Ch 2 - 461.200 - Race Control
Ch 3 - 464.500 - Staging Area
Ch 4 - 460.550 - Officials
Ch 5 - 461.625 - Officials
These frequencies are the most active. They aren't always used for
'official' business. People relaying messages to friends, concessions
requesting more cups, and ticket office needing permission to let someone in
without a ticket are the types of things you are likely to hear.
The latest edition of Police Call (which you can get at any RadioShack)
has a list with many of the drivers and crews. I don't think that they use
the radios from car to crew very often. The cars are just way to loud to
make use of the radio. I did hear someone on John Force's team discussing
which lane they should run. You should probably search the band from
457.500 MHz to 469.500 MHz. Most of the crew frequencies will be here.
When I was there TNN was televising it. I could hear two different
producers yelling orders to camera people and other TV crews. Seems they
were actually producing two different programs at the same time. Search
450.000 MHz to 451.000 MHz and 455.000MHz to 456.000 MHz. You are sure to
pick up something here. If you see the local media, then plug in their
frequencies. I have them posted on my site at
http://members.xoom.com/houstonscan/engfreqs.htm
I suggest that you take a notepad and write down all the frequencies
that you find active during searches. You will find quite a few (almost all
of them UHF). Also get a good headset for the scanner. You MUST have
hearing protection. RadioShack has a good model made by Koss called
SpeedZone. They cost about $50, but it is worth it.

Source record: 124428
Cross-posted to: rec.radio.swap,rec.radio.scanner,alt.radio.scanner

Never use your scanner's tiny keypad again.
Program your Radio Shack Pro 64 or PRO 2041 scanner directly from your computer. If you have a Pro 64 or Pro2041 You need this cable!
This cable runs between your scanner's earphone jack and any PC with a free COM port. Store and catalog all of your frequencies in a database on your computer, then upload them to your scanner in seconds.
$25.oo ea.

Some states are currently enforcing the law that requires you have 2 hands on
the wheel at all times.

Speakerphone gets around this nicely. No different than talking to someone
sitting next to you.

It is also called PL tones (Private Listening). Ex: In North Carolina you have Forsyth, Davidson, Davie, Randolph, & Guilford County's bordering each other. The State Rescue Freq. for NC is 155.280. Some county's dispatch on this freq. the CTCSS for Davidson County is 88.5 and the CTCSS for Forsyth County is 82.5, If the radio you are transmitting on produces the PL tone 88.5 when it keyed Davidson County Dispatch would here you, but Forsyth County would not.

To put it simple, it would not help you while scanning. Another ex: is your Squelch on your scanner

Closeout price has nothing to do with fair market value. The 2006 is a good scanner, parts are readily available and some may still be under an extended warranty.

> I've actually seen prices going for $250 to $400 on the newsgroups.

$250 is a fair price, you are out of line to suggest it's not. $400 is absurd,
but unless you're a socialist, free market, means - free - as in- what the market will bear, price police notwithstanding.

Tell me you wouldn't try to sell your car for as much as you could get for it, especially if it was in good shape. Do you think anyone would care if you got a year end clearance price? It has absolutely nothing to do with what it's worth now.

> Commtel distributes a PRO-2006 "clone"
> which I have seen selling new for around $300 shipped!

Great! Now cry me a river when US Customs seizes it and you're stuck with the $300 credit card bill. You don't think it happens? Hahahahah, I heard Customs looking for illegal CB linears and cellular capable scanners just a few days ago at the airport on my legal scanner.

I'm sorry if you think people are asking too much, but you are going mostly on emotion and very little on fact and logic.

> have suggestions?

Try this, switch the radio off; press together MANUAL, 2, 9; switch the
radio on, holding the buttons for a few seconds. A pop will be heard from
the speaker, signalling erasure of all frequency information from the
memory channels.

I haven't tried this, though. It's simply what is written on the sheet of
info Grove included with my BC200XLT.

Good luck,
Mike

I am in need of some help with a problem and don't know exactly who to go to. I am totally unfamilar with scanners, amateur radio and the like. Any expertise anyone could offer will be greatly appreciated.

My problem is as follows: I have, within the past week or so, started hearing what sounds like some king of CB signal coming in over my home stereo speakers. These signals are actually coming in over any set of speakers that are plugged in at my house, including computer speakers and TV. The signals are just barely audible but annoying nonetheless. The volume of the signals is not under the control of the electronic equipment from which they are heard. The only way I can stop the signals is to turn off the system, turning the volume all the way down doesn't work. The originate from the same person at about the same time everyday. The person seems to always seems to state the town he is from (the same town as I am in). I never hear any other person even though he's apparently talking to someone. Each of his transmissions end with a "beep".

I would like to know what kind of signal might be able to do this kind of thing. (I have never heard of any kind of radio signal coming through speakers without a reciever.) Do you know if there is anything that can be done to block this type of signal from coming through my speakers?

I appreciate any input or referral to where I could go to get information of the type of thing.

Thank-you,

Wesley
Forest City, NC

Hi Wiggie,

I allways enjoy your hints and tips especially on this receiver,
since I have a Pro-2042/OS535/Probe combo myself.

Does the backlight of the Pro-2042 go dim after a few years
of operation (like the Pro-2006) ,or has this since been fixed ?

Regards,
Knut Otterbeck
Oslo - Norway

To elaborate, decades ago when hams sent large amounts of third party
messages via the (CW) national traffic nets, there were many common phrases
abbreviated with 2 digit numbers, for ease and speed in CW transmissions.
73, (best regards) and 88 , (love and kisses) are two common ones still used
today. You can probably find a complete list of these abbreviations through
the ARRL.

That's interesting.......I exchanged the antenna this afternoon, and this one seems to work well on 800MHz. But it doesn't work any better than the standard duckie. It's rated with a 3 dB gain (gain against what? an isotrope radial perhaps?), but with a 3dB loss in the adaptor I'm back at zero. The nice thing about this antenna though is that you can bend it so that the scanner can lay down on its back.

Btw, the RS guy put the old antenna right back on the shelf after I explained to him it was broken.

Well, take your standard 2050 and add:

Computer Control
CTCSS Decoding
Autostore
Tuning Knob
(there's more but I can't remember...)

and you would have a scanner that is just like the 895xlt. Then knock about
$10 US off the price.

Tough call, huh....? ;-)

Guys, Mr Mackey, Mr.May and the others that keep this flame war alive:
Why not request a new news group where you can fight this out to your
hearts content.
This garbage has gone on for far too long. Please just kill each other, form
a new group or find another hobby. For it has become all too clear
that your hobby does not involve any aspect of radio, either scanning, swl or
ham/cb. This is the "rec.radio.scanner" group not the "lets flame until
we run everyone else away" group.
I do not know, nor care who did what to whom when. I would just like to
read posts that are on topic.
I check back about once a month hoping that sanity will win out.
Get a life and give us back our news group.

I have an AOR 8200 full cell coverage for sale. You will not find a better price on this model anywhere. Scanner was used for approx. 1 week. I still have original bill of sale that shows my cost of $859 CA + 7% tax =$920 Canadian dollars.($605 US)
My price for this is $510 US or $765 CA. You will need to pick up the shipping for that price.

Included is the following: AOR 8200 Scanner
Premium AOR vinyl carry case (worth $20 US)
4 ni-cad batteries
12v cig. adapter
Scanner is guaranteed new condition complete with 1 year (less 3 weeks) warranty which will be transferred to you.
Do your homework then save some cash. Same day shipping....
I am in Ontario Canada to give you an Idea and the shipping weight is 2.25 lb. size is8" x 10" x 3"

Yes, but then there's shipping, too. Plus if you get the unblocked version (who wouldn't want that?) then Customs might seize it at the border.

OR....

You can contact this individual and, if you live in the Phoenix metro area as I do, drive right down and pick this one up yourself (allowing one to inspect it before purchase - even better!)

If I had the extra $300, I'd have jumped on this one...

The used market is excellent for the 4/5/6 scanners. It's the supply and demand principle. It's not secret a used one on the net sells fairly quick. Check out the Ebay past auctions if you want to see some crazy prices. I've got some decent buys there, but sometimes the bidding gets way out of hand, especially when a Pro-2004 will go for more than a 2006. I guarantee if I can buy one cheap and make a decent profit on it, then I don't have a problem with that.
It's nice something holds its' value better than this computer I'm using!

I agree. It would seem that ignoring him does nothing to deter his behavior.

This is a letter that I have sent to Dejanews regarding this problem:

John,

Please refrain from spamming the rec.radio and alt.radio newsgroups with
these off topic messages. A copy of this message is being sent to dejanews
to alert them of this unwanted behavior, and to request that they do
something about it if you don't.

Thank you,
-Phil

included for reference:
<The offending message is quoted here>

I have, and will continue to post this letter as a reply to each off-topic
post, cc'ed to abuse@dejanews.com I figure they will receive at least 20
messages a day from me alone. If we all do this, they will yank his dejanews
account faster than you can say "Off Topic Mindless Junk Posts".

If the behavior continues after that, then we can concentrate on his ISP,
which incidentally, is not usa.net. Instead direct your complaints to
abuse@home.net

Rick,

See http://web2.airmail.net/lblant1/dfw/digital.htm for information on the etrunk.exe utility. There are detailed instructions there for getting started with EDACS trunktracking today using a two scanner setup and the etrunk utility. There you can find the absolute latest downloads for the trunker and etrunk utilities, as well as detailed information for getting started.

The BC-245 is expected to be released here in May, and it will support EDACS scanning and multiple trunking system scanning.

Stay tuned!

>Buyer Beware

Ron,

For someone who has not seen the software that's pretty harsh words.
And what's wrong with going through a dealer network and not selling
directly? Ever think it may be more efficient to do so?

Sounds to me that you are not informed. Before you make statements
like the above (buyer beware), make sure all your ducks are in order.

And for demo software, how do you plan to do this with trunking
software? Do you see Uniden with a demo Trunk Tracker? And TrunkTrac
(in my opinion the BEST Motorola trunking software written) does not
have a demo version either.

4745. San Jose PD redistricting took place over this past weekend

Newsgroup: rec.radio.scanner
Date: 1999-03-23 00:00:00 UTC
From: "Robert H. Eisner" <rheisner@worldnet.att.net>
Message-ID: <36F71831.1648@worldnet.att.net>
Source record: 124287
Cross-posted to: rec.radio.scanner,alt.radio.scanner

It appears that the San Jose PD have completed their redistricting as of 3/21/99. The following are the new frequency assignments for the new districts:

Western Dist D F & R 1 460.150 131.8
Western Dist N & S 2 460.275 162.2
Foothill Dist M & W 3 460.200 136.5
Foothill Dist C & P 4 460.425 167.9
Central Dist K & V 5 460.400 146.2
Central Dist E & L 6 460.325 146.2
Southern Dist A & T 7 460.475 136.5
Southern Dist X & Y 8 460.525 179.9
Citywide 1 9 460.100 136.5
CLEMARS 10 460.025 179.9
Citywide 2 11 460.050 110.9
CLEMARS Direct 12 460.025 179.9
Tactical 1 13 460.175 186.2
Tactical 2 14 460.300 203.5
Tactical 3 15 460.375 203.5
Citywide 1 Direct 16 460.100 136.5

Does anyone have an up to date district map for the redistricting that just took place? The district map on page 357 of Police Call Volume 9 for this year seems to be fairly current, but it does not include any of the new districts such as C, D, E, F and V. I think district D is assigned to units at San Jose International Aiport (SJC).

Bob

PS: The following is a copy of an article that appeared in the San Jose Mercury News back in February:

==========

S.J. police plan to revamp beats

Redistricting designed to better service

BY RAOUL V. MOWATT
Mercury News Staff Writer

Of the various projects San Jose police have in the works, few have the potential impact of redistricting.

The department is on the verge of reallocating its patrol officers based on calls for service within the last few years. The idea is to give more

efficient and complete service to residents.

The payoffs, according to police brass, will range from more officers on the street at peak times for crime to a greater affinity between officers and the neighborhoods they protect.

``The thought process in redistricting is to give officers more time to do follow-up and to do community policing,'' Chief Bill Lansdowne said.

Ideally, redistricting should occur about once every five years, police say. But the department last redid its patrol boundaries in 1986.

To say that the city has dramatically changed in that interim would be an understatement. The city's population has increased by as much as 160,000. Redevelopment money helped create an urban downtown. Police now receive as many as 525,000 calls in a single year.

The department set up a committee in 1995 to begin the process. The committee's plan are to be implemented on March 21. ``It is probably the major project the department has been working on for the last few years,'' Capt. Tom Brewer said.

The department currently spreads patrol officers over 12 districts and 61 beats. The new model will have 16 districts and 83 beats. Generally, officers will be responsible for a smaller area.

Lansdowne and Brewer say they hope for improved response times, but have not set goals for how much they may drop.

The process will also equalize work for officers across the city. Under the current plan, an Almaden Valley police district had 14,000 calls for service in a recent year, compared with about 27,000 calls for service in a downtown district.

Lansdowne and Brewer said it will also address one of officers' perennial complaints: that officers are going from call to call to call, always lacking the time to focus on crime prevention.

Under the new plan, officers will have 40 percent of their time free, and the police brass are hoping they will spend that time meeting people and developing solutions. Lansdowne said he envisioned officers devising six-month plans to tackle problems on their beats.

``We like to consider the sergeants and the officers as the chiefs of police for their particular areas,'' Brewer said.

It will also give sergeants fewer officers to supervise, police say.

The plan also increases the number of patrol officers slightly, from 526 to 546. And the plan comes with a shift in philosophy, Lansdowne said. He said the department would re-examine how its investigators and other staff are distributed.

The chief also said the department has emphasized full staffing for specialty units to fight gangs, narcotics and to serve other purposes,

occasionally creating shortages of patrol officers.

Now, Lansdowne said, the department will commit to fully staffing patrol. ``We say this all the time, that patrol is the backbone of the department, but we've never treated it that way,'' Lansdowne said.

>help would be appreciated.

Make sure your computers cases are on tight, and that you have used a real 3
prong, grounded, outlet.
Put clamp-on ferrite cores onto every cable coming out the back of your CPU,
especially your video cable. If you still have rfi put one on the keyboard
cable, at the back of the keyboard. If you have a laser printer, be sure you
have a ferrite on both ends of the cable. More than that, put your antenna as
far from the cpu as possible.

Good luck,
Howard Higgins

Which reminds me...

When I was a boy growing up in the 60's in Southern California, there was a mischievious popular song that briefly appeared on the AM radio. Ostensibly a bubble-gum pop rock song, it had these strange background vocals, sung sweetly:

Dit dit, dah dit
Dit dit, dah
Dah dit, dah dit
Dah dit, dah

I kid you not! I was a Boy Scout at the time, and had recently studied Morse Code, so I was happy to be in on the joke. As far as I know, the song just faded from the pop charts without the AM stations ever having been the wiser. Does anybody know what it was?

I think it would be better if it ALL stopped. Perhaps Blake is willing to let that happen. See if you can talk him into it!

Marge has never made ANY public post to indicate what you say
above. You are using her to build your lies again, BLAKE BOWERS!

The fact is that you interferred with an election on Fidonet,
Marge had to step in & take action & you were not heard from on that
echo for about 90 days. You have NEVER been able to produce ANYTHING
to dis-prove this (according to a search of Dejanews)!

i have an old radio shack pro-2020, and it is still working, at least
it will work on 12 volts, and this junk works on off voltages, for example
10 volts, you can't even use most of them on 12-vdc? i guess radio shack,
or as we call them "radio shaft" here in the south. is still making stuff
that can't be interchangeble.

Hi,

If anyone has an old Uniden Bearcat 200xlt scanner sitting idle and would like to part with it, I am looking for a back-up and I think this is the one I am after!!

Please email me with the price you are asking for it (in Australian $ with postage added on to get to South Australia) and I'll get back to you if interested.

Thanks in advance,
Richard.

Hello.
I&#65533;m wondering if someone has any opinions about the Scanmaster Base B1300 antenna...Performance-Good/Bad?
Scanmaster also has a Discone D1300 antenna, which antenna of these two is the best choice to hook up to a Uniden UBC-9000XLT. I listen to the whole 25-1000Mhz range, but most 70-80Mhz.

Thanks for any advice

Oden

No rumors. Uniden handed out ad flyers for the upcoming BC245XLT at
CES. Have heard they are pressing hard to get the prototypes ready
for Dayton Hamvention in May.

Considering today's equipment, you can customize your own
system using two radios (one with discriminator output, the
other with computer control) along with ETRUNK freeware:

http://www.geocities.com/CapeCanaveral/Lab/1060/trnkv3x.htm

Or you can buy an OptoCom ($470) and E-Trax software ($90):

Sorry, but the "ten codes" are NOT universal. Different departments and
different areas have different ten code. Check your local Radio Shack for
their "Police Calls" frequency book. It usually has a set of ten codes in
it. Also, you might contact the agency that you are interested in and ask
them.

Mobile Frequency Counters for sale...
(The following units are new in the box)

(2) Para Dynamics Model PDC-250 ($35.00 each)
5 digit readout
Frequency range in two settings
low 1--99MHz
high 1--250MHz
Operates on 12VDC for mobile or base operation
Compact for easy mounting to radio or under dash
Supplied with mounting hardware & operating instructions.

(1) Para Dynamics Model PDC-256 ($60.00)
6 Digit readout
Frequency range 500Khz--29.9999MHz
operates on 12VDC
Unit wires to the inside of the radio to display
operating frequency without having to key the Mic.
Supplied with wiring instructions for Cobra 148 &
and radios with simular chassis.
Supplied with mounting hardware & operating instructions.

All prices are firm, I'll pay shipping on pre-paid sales.
I will ship COD, you pay shipping and COD charges.

If you are interested in any of these units contact...
TRAMD300@aol.com

Thank you...

4776. Decoding FSK Data in Software

Newsgroup: rec.radio.scanner
Date: 1999-03-23 00:00:00 UTC
From: cloaked@nowhere.gov
Message-ID: <36f7b2ce.2314236@news>
Source record: 124318
Cross-posted to: comp.dsp,rec.radio.scanner,alt.radio.scanner

I've seen several programs (see for example
http://www.muenster.de/~welp/sb.htm) that use a SoundBlaster or other
audio card to sample the audio output from a radio receiver and decode
the FSK data (e.g. POCSAG, MDT, RTTY, etc.) My understanding is that
the basic technique is to sample the data in real time, process it
using some technique such as a discrete Fourier transform, and somehow
produce a binary digit stream for further processing. I know virtually
nothing about DSP, but I'd like to understand more about how these
programs work, both in theory as well as in actual code. I'm also
interested in learning about the various modulation techniques, such
as FSK, AFSK, BFSK, etc. etc.

Can you point me towards some good books and/or other information
which would help me? Thanks very much.

Scott Coleman, President ASRE (American Society of Reverse Engineers)

Too bad you didn't wait until April First to post that. You've shown a complete lack of disrespect to the Usenet community for several years. You've contributed nothing educational to any NG you've infected. The world would be better off without people of your disposition.

Have a productive week, doing what ever it is you do.

You might want to look at the Icom PCR1000. Covers 10Khz to 1.3GHz.
AM/FM/FMW/CW/LSB/USB [Bandwidth is 3/6/15/50 and WFM is??150 KHz]
The 50KHz is great for NOAA APT [Polar orbital weather sats].
There are a lot of arguments over the '1000s SW sensitivity.
I found it comparable to some fairy good SW receivers [Kenwood
R5000/R2000, Collins R390]
It is the first radio that I have been able to recieve WWVB at 60KHz.
30-1000 is great. There is not above 1090 ATC transponder so IO have yet
to "hear" anything up there. ATC transponders are just a series
of "buzzes".
Cellular is locked out, thought there are "fixes" [open the radio,
remove two surface mount resistors, run a program to change the country
ID], but I am not into cellular so it was not a loss for me.
Cost $499 (us) plus the DSP unit is another $150 (great for SW, but
not too usefull for "scanning").
Icom has another litle brother the PCR100 everything but the LSB/USB/CW.
Costs $325. I have never seen a 100, so be sure to check it out to see
if it could do what you need.

>County is 82.5, If the radio you are transmitting on produces the PL tone
>88.5 when it keyed Davidson County Dispatch would here you, but Forsyth
>County would not.

So is this what I am hearing that is driving me nuts. I
live in East Texas and while going through various searches
I run across transmissions where I can tell someone is
transmitting but they are drowned out by static, as if the
squelch was fully open, accompanied by various tones. One
can sometimes catch a couple of words in the clear as the
mike is un-keyed. Is this something else, can I filter it
out some way? I seems almost all of the 152 Mhz area around
here has this noise as well as some of the PP 154-156 Mhz
services which are sometimes in the clear and other times
not, but on the same freq..

Thanks
Chuck

4781. new multi-mile cordless

Newsgroup: rec.radio.scanner
Date: 1999-03-23 00:00:00 UTC
From: michael@ablecomm.com
Message-ID: <7d8hq8$5b5$1@nnrp1.dejanews.com>
Source record: 124323

AbleComm has just started selling a cordless phone that we think has the longest range of any cordless that can be legally used in the United States. It easily beats the previous champ, the Panasonic KX-TD7890.

The new "EnGenius SN-900 ULTRA" is 900MHz Digital Spread Spectrum, with Caller ID on Call Waiting, super sound, and lots of sensible, easy-to-use features.

The LCD display shows three lines of text and symbols, with big letters, and illumination for night use. There is no headset jack.

As with the 7890, you can mount the base in a location that provides the greatest range, and keep the handset on a charging cradle that needs AC power, but no phone jack. Each handset comes with two battery packs, two antennas of different lengths, and a leather case.

You can have up to 4 bases with 36 handsets, and handsets can talk to each other without involving the base or the phone line.

Range can be up to FIVE MILES. The base can use an optional range-boosting external antenna.

Within a building, you can have the base ELEVEN FLOORS away from the handset.

The phone is EXTREMELY well-made.

With EnGenius, you can provide phone service to a location where you can't install wiring, or provide cordless operation over a very wide area.

Full information and testdrive are online at
http://www.ablecomm.com/multimile.htm

AbleComm,Inc. - www.ablecomm.com -- biggest source of Panasonic phone system info; discounts for do-it-yourselfers

I remember hearing that song just _once_ on a local FM, on a
graveyard shift a reallly reallly long time ago. It just cracked
me up, and I'm sure I was probably the only person listening at
that time of day who "got it."
Never heard who did it, what it was called, but obviously someone clued
in the station and it never was aired again AFAIK. I'd like to find out
more about it as well.

> Try 896.000 for McCabe ambulance ...

896.000 MHz is not a valid transmitter frequency. In FCC files it is a placeholder, indicating an end-user licensed to use a commercial repeater (SMRS) in the 935-940 MHz range (i/p = 896-901). The FCC has since ceased licensing end-users entirely and these entries will gradually disappear as they come up for renewal. Only the SMRS operator, either conventional or trunked, is now licensed and he is responsible for the end-users.
The same convention applies to 800 MHz SMRs, where the placeholder is 806.000 MHz.

Greetings,

There are NO new 2006's available from the UK, they are a clone. They
are illegal to import and could be confiscated by customs. There is also
a rather large fine and jail time involved if customs decides to press
the matter. It's just not worth it to possibly save a couple of dollars!
I'd rather have the "real thing" anyways.

Source record: 124379

Hi,

I have just released a nice little Software for:
(download from my page)

Read/write/edit any SmartCard like
- async.T=0 (GSM SmartCards)
- sync. Telecards (Phonecards)
- sync. I2C (Towitoko Cards, 2Kbit-64Kbit, ...)
- sync. 2-wire (German Social insurance, ...)
- sync. 3-wire (German Social insurance, Towitoko Card with Pin, ...)
- sync. microwire

Read/write ANY Serial EEPROM
- I2C (24C00,24C01,24C02,24C04,24C08,24C16,24C32,24C64,24C128,...)
- Microwire (93C46,93C56,93C66,93C76,93C86, ... 8 and 16 bit org.)
- SPI (X25C02,X25020,X25040,X25057,X25138,X25170,X25330,X25650,...)

It is developed with and for the makinterface,
but some parts of it might work with some
other interfaces like the DumbMouse, SerProg,
Phoenix, ...

What this has to do with Radio Amateur :)))))

These nice little EEproms are in almost every
device today. In your GSM phone (containing
the byte for activating the engeneering menu),
in your DVD player (containing the country
code), ... and of course in EVERY Radio Scanner
and Radio Transciever.

I have read (and written to) without problems
the EEproms on my TM-V7 and IC-Q7.

And I am VERY disapointed in ICOM.

The EEprom is used only 25%, the rest is EMPTY.

I don't understand the world any more, instead of
pushing the technologie to the edge, ICOM is cutting
the Frequency range, the number of memorys, ...
and the Hardware is all there.

What a shame, in the intention to sell the IC-R2
they have crippled the IC-Q7.

Well now I am playing a little with the CPU, the
M38267M8L-209GP, I have found the assembly language
manual, ... and with a little luck we will be able
to write our own firmware soon.

And I bet my Firmware will be better then ICOM's, :)
it will have 800 memorys, 80 scan edges and will
cover 0.5-1.6GHz :), and I will help ICOM a little
bit, I will make the IC-Q7 the best mini HT :)))))

Please don't ask my about the possibilitys the
EEprom reprogramming will offer for the IC-Q7,
I have to explore a little bit (In my free time)

The Software was tested with every SmartCard and
EEprom I could find, play a little with the
Software and report any bugs, sugestion, ...

Scott,
I can't speak for all sacnners, whether commercial or custom
offerings, but the ones I have seen work by decoding a series of
sub-audible tones on the system frequencies. In other words, they
work just like CTCSS/DCS decoding, which is legal, and do not
perform decoding of the digital data on the data/control channel.

HAARP TO CONDUCT LISTENING, AMATEUR TESTS

(via ARRL Bulletin)

The High Frequency Active Auroral Research Program (HAARP) facility in Alaska, will
conduct a second HAARP Listening Test in late March. HAARP also will conduct an Amateur
Radio experiment earlier in the month.

HAARP will transmit March 26 0800-0830 UTC and March 27 0700-0730 UTC, seeking
reports from hams and SWLs in Alaska and in the "Lower 48." The HAARP facility rarely
transmits, but its previous listening test in March 1997 was so successful that it has decided
to conduct another one.

The listening test transmissions will be on or about 3.4 MHz and 6.99 MHz. HAARP will send
a CW message and request signal strength reports. HAARP's Ed Kennedy, K3NS, points out
that the test times are early ones for those on the East Coast, but he says they represent the
best chance for listeners in that part of the world to hear HAARP. "They lost out last time due
to poor propagation conditions," he said.

The 1999 listening test will begin on the hour on 6.99 MHz with an ID, followed by three
four-minute periods of carrier only for signal-strength measurements, then a CW message. A
somewhat shorter test will begin at 20 minutes past the hour on 3.39 MHz, with an ID,
followed by one four-minute carrier and a CW message. QSLs will be available only for reports
mailed to HAARP, PO Box 271, Gakona, AK 99586

HAARP also will conduct what Kennedy calls "a true Amateur Radio experiment" in
conjunction with the March research effort. The ham experiment, March 20, 2200-2400 UTC,
is being organized by Ed Cole, AL7EB, with cooperation from several participants in Alaska
and Canada. As Kennedy explains it, "HAARP will attempt to generate

field-aligned
irregularities in the F-region over the HAARP facility, and the
participants will attempt to
establish communication links by scattering VHF signals off the FAI."

Each HAARP transmitter can produce 10 kW of RF output between 2.8 and
10 MHz. For the
listening test, HAARP will use all 48 available antenna elements but
run transmitters at half
power, around 480 kW. During the Amateur Radio test on March 20, HAARP
will run full
power--960 kW.

HAARP's stated scientific purpose is to study "the properties and
behavior of the ionosphere,
with particular emphasis on being able to understand and use it to
enhance communications
and surveillance systems for both civilian and defense purposes."

Lots of variables with that one. Even so, many products sold exclusively
though dealers still have informative WWW pages. Efficient? For who?

> Sounds to me that you are not informed. Before you make statements
> like the above (buyer beware), make sure all your ducks are in order.

Hey! Dan Rathers did enough duck damage. Pick on Geese or corn!

> And for demo software, how do you plan to do this with trunking
> software? Do you see Uniden with a demo Trunk Tracker? And TrunkTrac
> (in my opinion the BEST Motorola trunking software written) does not
> have a demo version either.

Motorola is not marketing to the hobbyist either. I have used logging
programs, receiver/transceiver control programs, APT satellite decoding
software and many other with demo programs. Some run with live data but only
operate for a short period of time or have certain features disabled
(crippled demo). Regardless, most allow you to get a feel for the software.
One company's receiver control demo is just the program running with dummy
data. You don't even need a receiver to run it. Point is you get to feel the
software.

Buying software without seeing and using it. Naw, not for me either.

They certainly are not going to pay attention to a complaint that is NOT valid identity!Plus, if you aren't brave enough to put your legit ID behind your complaints then
apparently your complaint is bogus.

Also, remember that this country is based on such principles as "the right to face the
accuser"! Or don't you believe in a democratic society?

> And don't give me that line about policing via peer pressure. That's a
> crock, because you don't even follow it - how

Since you have never successfully passed a amateur license test I wouldn't expect you
to know such things as self policing by peer pressure, a corner stone of amateur

that has been successful for several decades.

I was watching a NASCAR race this weekend and I noticed someone in the pit crew with a scanner that had a stubby (about 3" long) antenna. I presume this would be good for the 800-900MHz range. Does anyone know where mere mortals can buy such an item? Btw, I did order the 800MHz antenna from Uniden and they just sent me another rubber ducky (about 6" long) antenna.

SNIP

Blake -

People in numerous newsgroups & e-mail have stated in a common thread their dislike for your actions here on the internet & have said "complain about Blake Bowers"! It is time for you to stop all your needless spaming & stop all your harassment. You have stated your dislike for some of my posts also, so I suggest you & I BOTH simply STOP these actions together.

YOU, BLAKE BOWERS, now hold the ability to END all these problems that you have requested, including the cross-posting to alt.firefighters. You can use this to achieve better- ment or not as you chose.

Your actions, BLAKE BOWERS, not your words, will indicate your choice.

Otherwise, we will be forced to forward complaints of your behavior to the following: abuse@townsqr.com sharen@townsqr.com ztrow@townsqr.com support@townsqr.com

and his upstream at
abuse@uunet.com

Thanks to anyone who responded to my previous message. But my problem has gotten worse. I came home yesterday and, at the suggestion of a respondent, went looking for a large antenna in my neighborhood. It didn't take long to notice the guy two houses down standing on his roof adjusting his 20' tall antenna. I thought great I'll just go talk to him about the problems I've been having. So much for civility. He didn't care much about my problems. He said I must have cheap equipment, that interference like that was normal and that he was "only operating at 250 blah, blah, blah. Thats just regular AM blah, blah."?????? Basically it's my problem he's not going to do crap. He then added he was doing modification to his antenna and that it might help with the problem. Boy, did it help! The interference is several times worse. I now get interference on my cordless phone. He also told me there were filters I could get for it, but this guy has pissed me off. I'm not yet ready to eat some humble pie if there's some way I can legally get the guy to stop.

I've been told what he is doing is illegal, is that for sure? I don't want to seriously harrass the guy if he really isn't doing anything beside being a jerk. What law is he breaking? If I call the FCC will they do anything? Can local law enforcement do anything? Any thoughts or suggestions appreciated.

Thanks,

Wesley

I've had it since 94. Great set. It's the one with the barrel power plug in the rear, not the one with 3 power wires. In other words, it doesn't require a special power source just for the memory.

Anyway, I've been using this set in my home the exact same way for the last 5 years. It's plugged in to a wall timer and it's on all day and off at night.

About a month ago I noticed it seemed rather quiet. Went to check and noticed it was scanning all 5 banks on 000.000. All channels were erased!

So.....I filled it back up again. All is well again until the other night - same thing!

Is this something common? Is there a part I should be looking for to replace?

Thanks for any tips.

4843. Help Me Understand US Scanner Laws

Newsgroup: rec.radio.scanner
Date: 1999-03-24 00:00:00 UTC
From: cloaked@spamBgone.gov
Message-ID: <36f8f78e.3571056@news>
Source record: 124198
Cross-posted to: rec.radio.scanner,alt.radio.scanner

My understanding is that it is illegal to decode digital radio communications, such as pagers. If so, then how can trunk tracking scanners be legal? Both can be demodulated by the same "Hamcomm" interface, and neither is encrypted. Why is one legal and the other not? Perhaps it's based on content - paging messages contain actual messages from one person to another, whereas the control channel is just a computer instructing a bunch of radios which frequency to tune.

So, if it is legal to decode the trunking control channel, then it must also be legal to decode the control channels used by cellular telephones (as long as you don't use the ESN/MIN pairs to clone a phone for fraudulent purposes, or "trunk track" the cellular phone conversations ;-) Like the trunking control channel, there is no human-to-human message contect, only computer-generated frequency assignments.

Can anyone point out a flaw in this reasoning?

Scott Coleman, President ASRE (American Society of Reverse Engineers)

Problem with that is, many of the people whom sell on e-bay, often get quite a bit more than what they would here.

Over time, I have noticed quite a few people sellling audio/scanners on e-bay, not to enhance their hobby, but to make a quick dollar.

Nothing wrong with that, I just don't think it would work on usenet, because audio/scanning enthusiasts will not be bidding each other, to near retail prices.

Capitalism works for the individual as well as companies. If this is correct, e-bay is making a business decision, and not a moral decision.

People will find another internet auction site.

I see several things coming about due to this:

There won't be daily posts on: Go to e-bay and bid-up the price of this scanner.

People whom are merely selling to make a dollar or two, which is fine with me, may find it a little harder, and have to get a few less dollars.

Some will start selling more scanners on usenet, which will defin. not command the near retail prices quite a few audio/scanning auctions have been getting.

Capitalism works for individuals as well as companies. E-bay is making a business decision. Whether it is for legal reasons, or covering their "corporate butt", they are making a decision they feel is in the best interest for them to make money in the future.

Let the people who have been selling scanners, post theme on the scanning/radio usenet groups, and maybe the enthusiasts will be offered a few more opportunities to add to their equipment. Of course, more than likely, the prices will be a little different.

ctmiles, what you are getting is interference from a paging transmitter. These transmitters are in the 152mhz area, and also 158.10mhz. Having to reach a radio (pager) with no external antenna they use several hundred watts of power. Your scanner is being overloaded by the signal due to it's (necessarily) broad front end. Grove Enterprises sells filters made by I think PAR. They arn't cheap, ($50+) but the one I got to filter out 158.100mhz works very well with negligable effects on other freqs. If you are having strong interference on freqs you need to hear, as I was, they are well worth the money. You need to know which freq. is causing the problem, 152 or 158, and order the appropriate filter.

Howdy's

I am in need of a PRO-43, would like to trade even for my my PRO-90 trunktracker.

My primary interest in scanning changed from listening to police and fire to monitoring aircraft, so I need a scanner than can cover UHF airband.

The PR-90 is in great condition, has charger and manuals, but no box.

If interested

Hi everyone,
I got a BC-230XLT for Christmas.
The bottom of this thing has a date code of O1HE (or something like
that)
It also says on the bottom, that it is a BC-220XLT.

What mods are available for this scanner?
I've scoured the net and couldn't find anything.

4854. MDT Monitor Version 1.5.0 Available

Newsgroup: rec.radio.scanner
Date: 1999-03-24 00:00:00 UTC
From: MDT Monitor <mdtmon@hotmail.com>
Message-ID: <7db8diftv1@nnrp1.dejanews.com>
Source record: 124209

MDT Monitor is a Windows program that allows you to monitor MDT traffic on systems that use Motorola's MDC-4800 protocol. To use this program you'll need a scanner with a discriminator output, a Windows PC (running Win95, Win98, or WinNT 4.0), and either a sound card, a HamComm-type data slicer, or an RM100 decoder.

The program (and source code) are available at

http://www.geocities.com/ResearchTriangle/Facility/7646/index.html

---

Here's what's changed since my last posting (in early March 2nd):

Improved the programs ability to recognize retransmitted packets sent to the same terminal over and over (due to terminal not acknowledging receipt of packet) and filter them out of the display. This will only work if the retransmitted packet is received by the program the same each time (either no errors in the retransmissions, or the same errors in each).

Added activity indicator to right-side of toolbar. A green LED lights whenever data is received. LED lights for about a half a second after the last packet was received. LED is not visible when no data is being recieved. The LED can be turned off via an option in the View|Options window.

The status bar message now returns to "Monitoring" if no new traffic received in three seconds.

>Then why isn't he using his Kansas address?

He doesn't have to. The FCC only requires that we maintain a mailing address in which we can receive correspondence from them. That's one of the major faults with the Vanity Callsign farce. The Pacific Island call area (Area 13) is being depleted of its callsigns due to PO Box schemes. For example, of the 200 Hawaii Extra Class callsigns, close to 10% have been sucked up by Mainland clubs and individuals. I've reported this to the FCC hoping to get those callsigns cancelled and returned for Hawaii hams.

Anyway, as long as someone is at his AZ address and able to forward FCC mail to him, he's free to live anywhere.

Regarding all of this, I just went to ebay and found tons of cell capable scanners there, as well, I checked their official "inappropriate" list and cell capable scanners aren't there either. I am beginning to wonder, is this whole thing true? Or did somebody just start this thread for his/her own agenda? Anybody have an OFFICIAL response from ebay? Would love to see it. It would be a shame if e-bay did indeed start restricting scanner sales. TTYL

Never try to reason your way around these regulations. Reason is not a criteria used to write them. I suggest you spend time reading them. It's in 47 CFR Part 15. And, no, they don't make any sense. If it did, do you think so many folks on these news groups would make so many angry posts about them?

4861. Pager splatter on BC895XLT

Newsgroup: rec.radio.scanner
Date: 1999-03-24 00:00:00 UTC
From: "John M. Greene, Ph.D." <jgreene@genelogic.com>
Message-ID: <36F92B55.4B7A0469@genelogic.com>
Source record: 124216

I just received my new BC895XLT - but got a rude surprise upon setup.
On the VHF-Hi band, splatter from a paging transmitter(s) covers several
MHz of spectrum, making it very difficult to monitor the fire dispatch
or my local police in the 154-156 MHz range. I can even hear the
splatter in the 2M Ham band at 146MHz .I do live about a mile from a
strong pager transmiter site on top of a building, but I never had this
problem with my old PRO-39 (which is double conversion, not triple like
the BC895XLT)!

Could I have a defective unit? Is the front end on the BC895XLT very
easy to overlaod? Is there anything I can do to reduce the pager
interference?

Thanks for the help!!

The 895xlt is a SUPER sensitive unit. I get interference from cell phones and pagers in the VHF bands and also the UHF bands when I have it connected to the antenna in the car.

There are a couple of things you can do. The easiest and cheapest (i.e. free) way to eliminate the interference is to set the CTCSS tones (assuming of course that your local PD is using them) and run the scanner in CTCSS mode. If not, you can purchase a notch filter that will help reduce the interference. Also, make sure you're not using a super high gain antenna. Mine is hooked up to a cellular glass mount antenna with +2dB gain. Anything more than that seems to overload the unit.

John. Face reality. You are a spammer. You will be dealt with as such. Go ahead and prepare your complaint. I don't post the abuse messages from work, so you will have nothing to back it up. I don't even post them under a username that reveals my identity. I could even change usernames each night until @home gets sick of you and cancels your account due to spamming. Game over. You lose.

There's an easy way to end this, John. Just keep your little spat in your OWN newsgroup - you did claim it was YOURS didn't you? I won't send out any complaints unless I see your off-topic messages here in the scanner groups.

And don't give me that line about policing via peer pressure. That's a crock, because you don't even follow it - how many messages have been posted in the last 2 days asking you to stop? Yet you continue. So don't give us that line of B.S.

Just keep your little lover's quarrels in your own newsgroup. Then I'll leave you alone. Sound good to you?

<sputnik@voicenet.com> writes

Hi,

> the the opto456 board work with the commtel scanner (clone of the 2006)

Yes it will.

GRE produced the PRO-2006 for Intertan (Tandy) and the COM205 for Altai
(Commtel). Internally they are the same receiver with the only
difference being the external plastic case and its associated
identification.

The European PRO-2006 and COM205 were/are fitted with 220v AC
transformers whereas a US sourced PRO-2005/6 would have an internal 110v
transformer.

Cheers,
JC

>local law enforcement do anything? Any thoughts or suggestions appreciated.
>

Actually, if you and your neighbors get together and complain to both local law enforcement and the FCC then you should see some results. They will come and inspect his station, and if it's not legal, it will be confiscated and Mr. Jerk will probably get a nice hefty fine on top of it, and maybe even jail time. They key is to make sure you aren't the only one complaining - otherwise nothing will probably be done about it.

Let us know how things turn out.

Actually, all messages that I sent to Dejanews were returned. Apparently
this address is there for looks, and not function (which no doubt influenced
Mackey's decision to use their service.)

However, the abuse@home address is valid, and I received a reply stating
they are looking into the matter due to NUMEROUS complaints they have
received over the last 24 hours.

Keep up the good work everyone.

4870. FAQ - How to filter John Mackey's noise

Newsgroup: rec.radio.scanner
Date: 1999-03-24 00:00:00 UTC
From: Phil Smalley <ziggy7445@yahoo.com>
Message-ID: <7dbj9p$6rj$1@phxtst22.phx1.aro.allied.com>
Source record: 124225

This message is posted for the benefit of all:

Up until recently this has been more of an annoyance than a problem. A minor itch, if you will. However as of late, John has once again chosen to inundate the scanner groups with his flames and lies by the hundreds.

What can one do? You can of course post complaints to his ISP, which I and several others have already started to do. What he is doing is spamming, and most ISP's have a zero tolerance policy towards it. I see it as only a matter of time before action is taken. But what to do in the meantime?

Employ a filter. Over the past few days, I have constructed a great filter, and now hardly any of this gets through unless I wish to see it (which I will do from time to time to make sure that I don't miss any posts that are relevant to scanning. Today, however more than 50 "mackeyesque" messages and replies have made this impossible, so if I miss your post, I apologize, but I'm not going to look for them anymore)

Here is the filter you will need (of course you will need to adapt it to your own newsreaders' format):
Section Contains

From: 'KAOSSF'
From: 'jmackey'
From: 'usa.net' (this will nuke some valid posts too, so you may or may not wish to use it)
From: 'parg.org'
Subj: 'mackey'
Subj: 'liar'
Subj: 'off' and 'topic'
Subj: 'usanet'
Subj: 'who' and 'cares' (works on non-mackey nonsense too, like the CBRambo stuff!)
From: 'usa.wet' (he's used this before too)
Subj: 'forge'
Subj: 'John'
Subj: 'Blake'
Subj: 'medications'
Subj: 'cancel'
From: 'jdclamp'
Subj: 'shut' and 'up'

There will no doubt be more, but this is a good start for anyone who is now deciding to implement a filter. If you employ this filter, you will no longer see most, if not all, messages from or about John Mackey unless that is what you desire to do. Even this post will disappear like magic.

And I can hear old Looney Tune now... "Why don't you use it then? Why don't you leave me alone..." on and on he'll go. Oh well.... No sweat to me. This post is geared not towards John, but rather towards the thousands of scanner enthusiasts who would rather die than read any more of his trolling misery. In other words, people like me.

Enjoy.
-Phil

Interesting. I've heard it's illegal to record a conversation without a warrant unless one of the parties has consented to it. If companies actually have been doing this, they're probably violating federal wiretapping statutes. (The conversation doesn't have to be on a phone, and it doesn't matter if it's on private property, it still may violate the wiretapping statutes. It's not necessarily legal even if one of the parties consents.)

This story reads like an April fool's joke, but the date is wrong....

I have one of these.

The BC230 is the BC220 with an extra battery. That's it, no difference otherwise.

There aren't any known mods for it (not even discriminator out. Argh!) but cell images can be readily received from 896.1125 to 912 Mhz or so.

Anyone familiar with these antenna's?

I am looking for an antenna for my yet to be delivered base station.

Do these come with mounting/installation instructions for us newbies?

4878. SWR meters

Newsgroup: rec.radio.scanner

I need to pick up a SWR meter for tuning the antenna for my mobile cb's.

Radio Shack has a cheap one. Will this do the job?

Both can be demodulated by the same "Hamcomm"

Where can I find information on Hamcomm?
Thanks for any help
Ryan

Buy a replacement transformer for the Pro 2006 from Rat Shack and
switch them.
Or easier yet, run a AC adapter and plug it into the back.

4884. ** NEW ** LEATHER RADIO CASES - L@@K!

Try a AOR 8000/8200 , Uniden 3000XL, or a Sony Handeld.
Base, look for a AOR, Uniden 9000XLT or a used Radio Shack
2006/2035/2042.

EBAY is becoming the politically correct place to be.

First they banned guns, including relics and curios. Now scanners. I'm sure anything that could be used to "watch (or fight) the watchers" will be banned one by one. I think its time to tune them out.

STOP! Don't buy the RS PRO-90; instead, post a WTB for a BC 235XLT. It's a better radio and a little easier to operate. It will also have better resale value over Radio Shack.
Check www.uniden.com for more info. or www.usascan.com. E-mail me for more info.

I'm sure its aided the crooks more than the good guys.

Nothing like listening to bookies taking bets on my scanner.

I notice on my so called "blocked" scanner, I still get celular.

Its not as good though as my "unblocked" scanner.

Here are the freqs I get on my blocked scanner. I hear cellular
callers, ringing phone, etc.

851.0125
854.300
902.300
902.300
902.400
902.600
902.800
902.900
903.200
903.400
903.600
903.900 for some reason, this one is the most active.

> that channel really digital data?

Wayne,
Greg Knox, the developer of the TrunkTracking technology that
Uniden has licensed for its TTs, has made it clear that the digital
data/control channel is NOT decoded for this reason. From what I
was told by Greg, the sub-audible tones on the channels are used
for the tracking. I know Greg has decoded the data/control channel
but what it is used for, if anything, in the TTs I do not know.
Perhaps Greg will see this thread and comment accordingly!

> long) antenna.

For reception purposes at these races, your goal is to try and pick up
only the local driver/pit/officials traffic while ignoring other traffic
from outside the area. This is done on a scanner by using a stubby
antenna and sometimes you can even get by with no antenna at all!

Grove sells the ANT18. It's 2.5" high and has a BNC connector.
Try here: http://www.grove-ent.com/ANT18.html

You can also get the Diamond RH-3 which is 1.75". Comet sells
the Miracle baby which is similar to the RH-3, and Optoelectronics
sells the DB32.

That should give you plenty of choices!

Greetings & Salutations:

Looking for the interface software for the venerable Compuscan CP2100.
(1200?)

Preferably the IBM variety. If you have such, and want to have a little
commerce,

please advise.

Sincerely,
Dave Lovell, W9DAG

But did you actually look at the individual auction page or just the catagory listing? They still show in the catagory listing but several I tried to look at came up Invalid auction or auction closed.

I buy and sell a great deal on Ebay and sent an email to customer service asking about there policy, I have yet to hear back, when I do I'll post a copy here.

I have to disagree here. I wasn't on the team that designed the trunktrackers, so I wouldn't be as knowledgeable as Greg, but if the TT's don't decode the data channel then why would it need to find it?

No, it decodes that channel. Watch the display while tracking a Motorola system. You will see the little indicators along the top of the display showing the talkgroups as they transmit. Now, watch the scanner when it hits a talkgroup that you have selected to scan. The little indicators go away. When the scanner returns to the data channel, they are there again. The ONLY way that scanner could do that is if it decodes the data channel. No sub-audible tone could possibly give you that information.

So how can they legally do it? It's easy if you have Motorola's permission! Why do you think that Private Lines and phone patches aren't scanned? Because Uniden decided that scannists wouldn't find this interesting? Hardly! Big M told Uniden that if they wanted to decode the trunking data that these were off limits. No doubt they were also told that they had to convert the talkgroups to decimal before displaying them too. As long as they did all that, Motorola said "fine" to them decoding the datastream (with a nice royalty paid to Motorola, I'm sure..)

Again, I'm not employed by Uniden, nor am I a consultant on the trunktracker scaners, but this just makes sense. The idea that the scanner uses sub-audible tones to trunk track is, no offense, ridiculous.

But that's just my humble opinion....

No handhelds, but if you would be willing to go with a base unit, then an old 2004/5/6 with the proper interface board and your PC will do all that and more.

Bill Cheek's website has all the particulars, among other things.

Something to ponder upon.

No, the backlighting doesn't go dim after a few years and no the
problem hasn't been fixed either...the design of the backlight has
simply changed. The earlier backlighting method used a
Electroluminescent Panel. The Pro-2035/2042 uses nine (9) surface
mount LEDs for its backlighting.

The sub-audible tones on a Motorola trunked radio system are used to transmit a list of active talkgroups. If I recall correctly, each talkgroup is preceeded with a fixed 8 bit or so synchronization pattern, then the 11 bit talkgroup number is sent with 2 parity bits. The parity bits are placed in such a manner that they prevent the talkgroup bits from ever accidentally forming the synchronization pattern. Frequency assignments for each talkgroup are not sent on the sub-audible data.

This sub-audible data is sent to allow trunked system users that are monitoring one talkgroup to have their radios immediately switch over to higher priority talkgroups. When this happens, the user's radio probably first switches back to the main control channel to get the channel number of the higher priority talkgroup.

If the TrunkTracker does not use the main trunked control channel to find each talkgroup frequency assignment, then I would guess it waits for a new talkgroup ID to be transmitted over the sub-audible data, and then asks itself whether a new channel became active at the same time (or perhaps if an active channel just went inactive). If so then the new channel must be used for the new talkgroup. After a short time one should have a complete list of active talkgroups and which channels they are on. Of course, this is sheer mindless speculation on my part and may not at all be what really happens in

the TrunkTracker.

If I'm not mistaken, telephone patches and "car to car" transmissions are not included in the sub-audible data, which might explain why the TrunkTracker doesn't track them.

Frank

Source record: 124115

To Whom It May Concern :

I am not here to argue who is right or wrong, or to lay blame on anyone, especially since I have contributed to some of the flames and off topic posts myself, but I feel that enough is enough. I don't anyone outside of this small group (you know who you are) really cares about our bickering. And frankly, I am over it too. It was fun in the beginning, but the novelty has worn off. From here on, you will only see on topic posts from me. I have learned a lot from this news group, and I hope that more people will come around to learn about scanners and scanning, and not be scared off by the lude and off-color humor that is posted on this board by some people.

So I offer this openly to EVERYONE on rec.radio.scanner - Let's not lose focus of why this particular ng is here. Let's put the fun back into this group, before Usenet cancels it.

And it can and will happen if we don't start behaving. And then we can go and blame everyone else, but ourselves. Change starts with ourselves, and then everyone else. Take responsibilty for your own actions. Don't blame the world. The world isn't making us post off topic, we are doing it ourselves. Let's change - before it is too late.

I have spoken my mind and hope that everyone will take this to heart and do something to make a change. :>)

Choco

Wow....

This is all there is to find on this page now:

Due to legal issues, there is nothing useful on this web page!
Web Page Updated on 24-Mar-1999

You can e-mail me at beepman@geocities.com

Holy smokes....

I wonder if the RD/LAP project may suffer the same fate?

Hopefully Beepman will be able to tell us what happened... scary...
-Phil

I can't tell you about the rabbit ears....But I got a radio shack radial antenna for about 20$ and I
get a range of about 30 miles. Keep in mind it is a external antenna and I live in a valley. Plus the
radial antenna gets high&low band uhf and vhf.

Mitchell wrote:

I'm not sure how everyone got so far off the mark on how the TrunkTrackers
work.

The TT scanners use the control channel data. The Optocomm trunk tracking
system uses the subaudible datastream on the regular channels. For that

reason, they have slightly different capabilities. The phone patch issue has to do with Uniden's fear of Federal interest in their products' capabilities with respect to ECPA, TDDRA, etc. Monitoring of phone patches is NOT clearly illegal under current law, but if Uniden wants to continue marketing trunking scanners, they have decided, they must tread carefully in this sensitive area.

Not the cheap solution, but the pager filters made by Par Electronics that are sold by Grove Ent. really do the trick. And yes, my Pro-43 HH scanner w/ triple conversion is alot more susceptable to front end overload than my double conversion units.

Source record: 124157

The scanner covers 25 - 1300 mhz with NO gaps. All freqs within that range are covered. You can program up to 200 frequencies into the banks. I am including a $40 "Max 800" antenna designed to optimize the 800 mhz range, a second rubber ducky (along with the original) that is supposed to be the most highly rated available ($25), an AC adapter ($10), a 90 degree adapter for the antenna allowing use with the radio lying flat, and an outside antenna with mounting brackets and about 50 feet of coaxial cable with connectors on each end. This antenna would probably cost $75 to replace, with the coax and connectors. The unit is in like new condition, with box and manual. No scratches or physical defects. Works perfectly. Asking $350 and I will pay shipping, which will probably be about $20 with insurance. Email if interested.

Thanks

Tom

Message-ID: <19990324194630.03377.00001106@ng153.aol.com>
Source record: 124158

The Southern California Scanner Homepage has been updated.
A new format for listing frequencies is now being used and more
sections, such as nationwide frequencies and scanner links will
be added in the near future. Feel free to browse the new look on
the LAPD, LAFD, CHP, LP, and Culver City pages; or look at the
all new Security Gaurd, Wal Mart, and Mervyns pages. I plan on
adding such frequencies as LACoSO, USFS, Rescue, and more.
Don't forget to email me with your comments and suggestions Also,
continue to send in email links (name/location/email/homepage/
scanners used/favorite frequency groups). Happy Scanning!!!!!

Believe it or not (I am not making this up)...
My wife smashed up my Kenwood TH-78 HT, so now I have a bunch of useless accesories.

FOR SALE - CHEAP:
Kenwood TH78-a Accesories -

Kenwood Alkaline battery holder pack.
Kenwood Cigarette lighter power cable.
Original Kenwood DC power Cable for Hardwiring to +12vdc.
Kenwood mini HT - Speaker mic (the small little black one).
Original Stock Antenna.
Orginal Kenwood 'leatherish' grey case.
Some other stuff too...

Sell all of it for $25 + $5 shipping.
You can't even buy one item on that list for that price.

Email me at jgom@bigfoot.com

I am located in the Bay Area California - locals welcome to pick up in person.

He's right..... There is a .5Farad (yes FARAD) cap
used for backup in the A model. I've never seen one
of these bad in this set, but I've seen some bad solder
joints on the plated-thru holes where this is mounted.
There is also a small voltage regulator which feeds this
and provides the backup voltage while the unit is on.
I've seen some of these open up. Get the service manual
from Rat-Shak and check it out.

I'm looking for a handheld, trunk-tracking, cellular capable scanner
with at least 25-1300MHz coverage. Does any manufacturer make a
scanner with these capabilities?

Kind of like "skirting the law"! Your description reminds me
of Clinton trying to say her giving him Oral sex thing was not sex
because he wasn't giving her sex.

Frankly I am appaled & disappointed at these people who do
as you described, get a call from out of area when they
are not from that area. Such conduct is very poor.

Source record: 124176

I recently acquired a BC 210 XL table model scanner. Nothing really special but it is clean and has not been tampered with. It will recieve clearly if manually placed on a frequency but has noise that is usually squelched out if there is no transmission. It has a Auto-squelch position on the common squelch dial. The display shows the proper frequencies for all channels and all channels(18) recieve clearly.
Anyone give a novice who lives in the country and has no available technician a clue as to what could be wrong and any hints as to what I could do to remedy the problem. I want to send the unit to my daughter who resides near a high-crime area but it is of little use as is.

All,

A few days ago someone posted a URL for a site in the United Kingdom that carries aviation accessories and aviation montoring equipment. It was NOT Javiation, which I am familiar with. Anyway, the specific reference was to a "through the glass" mount antenna specifically designed for the civil and military airbands.
If you're familiar with that antenna, or the URL that was listed, please e-mail me with the info.

Uh, no, sorry. I put the commas there to better indicate the measures
of the song, but the decoding comes through loud and clear if you ignore
them. Just decode one letter per line, but only if you're 18 or older.

Rich, surely the control channel of a Motorola trunking system is precisely what a trunk-tracking scanner (like a Radio Shack PRO-90, PRO-91, or Uniden 235XLT) monitors and decodes to determine which frequency is being used by which talkgroup ID. Isn't the information on that channel really digital data?

If you can wait, Uniden will have a new trunk tracker called the 245XLT
out this year. It will have better features than the Uniden 235XLT,
which the Radio Shack PRO-90 is pretty much a copy of, since Uniden
manufactures the PRO-90 for Radio Shack.

Forget the "cell'moddable" request. U.S. Federal law requires Uniden to
build these scanners so that they can't be modified for cellular; and
you wouldn't want to, anyway - cellular is something most people quickly
get bored of listening to. Stick to police and fire.

You can go to http://www.strongsignals.net/htm/imp90.htm for info on the
PRO-90, and www.strongsignals.net for lots of other information on
scanners, including the 235XLT.

Well if you ask the guy's at HRO here in San Diego, they will tell you
that the one that comes with the bc235 is the best antenna for the 800
band and really is better than it need's to be.
Go figure..... Well at least they didn't give me the ol "you got
questions we got answers" line.

I have a mint Sportcat SC-150B for sale $100.00 shipped, (UPS ground or Parcel Post). Unit has been used three or four times for total of about 4 hours. Unit is complete as purchased in factory carton, wrapped, with all accessories. Additionally it will also include the auto-lighter DC adapter I

built which charges/runs the scanner, plus an 11" special low-band rubber duckie antenna which enhances lowband reception. You will receive the scanner

packed exactly as you would buy it off the store shelf, except the battery will already be charged.

Price is firm and I require payment up front before I ship the unit. A personal check will require clearance time before shipping.

If you wish, I can send you local (Central California) references you can call.

I wanted to view the item below

80895255 AOR-3000 Communication Receiver $305.00 10 03/27 20:56

and all I get is

Item "80895255" is invalid or could not be found.

so I sent eBay support an email about the problem and below
is eBay support email return.

Hello,

We can surely understand your concern in seeing that the auction you
have previously been able to access is no longer available for viewing.
When we end an auction, it is completely removed from the site and is
therefore no longer accessible. Additionally, it is possible that you
have entered an item number that is incorrect or that has expired from
the site. You might want to double check your item number and if the
message persists, this indicates that the auction is no longer
available.
Please let us know if we can be of further assistance.

Regards,
eBay Customer Support

Hi there,

Someone will correct me if I'm wrong, but I believe that the communication port on the Scout uses TTL to communicate. This is not the exact same as RS232 type of signal that your com port is going to use on your computer.

What this means, is that you will need a TTL <-> RS232 converter someplace in between. Optoelectronics Tech support is typically pretty friendly and helpful, you might want to pass a message off to them.

I believe some people have an interface-powered TTL <-> RS232 converter built into a cable someplace.

Hope this helps.

Absolutely like new with AT, hand mic (never used), and cables. No mods. Original boxes. One of the last ones made, 20 million SN. I bought it from the original non ham owner who never got his license who bought it new in 1991 and didn't even have a power supply. $760 firm + shipping.

Consider taking on trade: MINT Bearcat 9000xlt, Sangean ATS909, Grundig YB400, Sony 7600G or ??? Must be mint! Tnx.

>convert the talkgroups to decimal before displaying them too. As long as
>they did all that, Motorola said "fine" to them decoding the datastream
>(with a nice royalty paid to Motorola, I'm sure..)

Um, last time I checked, Motorola (big and powerful though they may
be) were neither law makers nor law enforcers. Decoding digital data
from the aether is a violation of a federal law (ECPA?), is it not? If
permission to violate the law would can come from some private
company, I'm going into business tomorrow selling speeding licenses.
;-)

It seems to me far more likely that there is some loophole int the law
which is being exploited.

I've got the RH-3. Don't expect to get great reception from it unless you intend on short range. I use it in my car when I am driving in the desert to listen to the CHP Extenders. That way if I hear something, I know a CHP unit is within a few miles and it would be a wise idea to slow down. :-)

Yep, Actually some of the old microntas were not that bad. The one I
have thats a combo SWR/fieldstrength meter is actually more accurate to
a higher freq than some of the other SWR meters I've tried. Good enough
for gov work anyway. I used to use mine on 2m and was actually fairly
accurate except it would read 1.4:1 instead of 1:1. So if I got it down
to that level I was in good shape. Some of my others wouldn't work at
all on that high a freq. I don't know what they are selling now. MK

I have an AOR 8200 full cell coverage for sale. You will not find a better price on this model anywhere. Scanner was used for approx. 1 week. I still have original bill of sale that shows my cost of $859 CA + 7% tax =$920 Canadian dollars.($605 US)
My price for this is $495 US or $745 CA. You will need to pick up the shipping for that price.

Included is the following: AOR 8200 Scanner
Premium AOR vinyl carry case (worth $20 US)
4 ni-cad batteries
12v cig. adapter
Scanner is guaranteed new condition complete with 1 year (less 3 weeks) warranty which will be transferred to you.
Do your homework then save some cash. Same day shipping....
I am in Ontario Canada to give you an Idea and the shipping weight is 2.25 lb. size is8" x 10" x 3"

While I agree that Uniden is trying to tread lightly, why wouldn't
Opto do the same? They allow listening of phone patches as well as
decoding the DTMF tones...pretty handy to find out what phone numbers,
bank accounts, are being keyed in. Pretty nasty too.

I'll admit that this is really a function of what the software allows
(Signal Intelligence's TrakkStar/Scan*Star) but it's also programmed
into the firmware of the radio (which technically makes it part of
Opto-owned hardware).

And you can listen to phone patches on a TrunkTracker just dandy.
Simply take the radio out of trunk mode and listen conventionally.

Obviously more here than meets the eye.

IC R7100 Speech interface and RS232 interface included. Scancat Gold software. Cellular included. S/N 01166

$700.00 firm there are a couple of scratches on the case (character marks) This thing has been around since before celluar blocking so it has to have some character marks. Works fine as far as I know; however I have been told that the Sideband is off freq.

I prefer a local sell since I hate this shipping/ money issue, however at this price it is a firm sale no refund regardless. If I ship it to you it is yours.

I sure hope folks take this to heart. I left this newsgroup 6 months
ago because of the bickering, and returned last week as I do
periodically to see if it was any better. What I discovered was that
it was time to leave again.

So what loss is that? Well, some to me, but I don't need help in
finding frequencies, I have all the CDs and know where on the internet
to get what I don't have. I can design and build antennas, receivers,
and audio processors easily - I have my degrees and 35 years of
experience. I do it for a living, in addition to technical writing
and other consulting services.

I don't know it all, and I learn new things all the time. There's
folks in here from which I have learned a lot. But I can help and

teach others too. And I enjoy it. But I WON'T be here to do so when I have to constantly read all this depressing name calling and character assasination that goes on here. I don't care what some of you think of others of you. Why not take it to private Email if you must vent? Right now, I got nothing against anybody here, a clean slate if you will. Choco, I hope you started something good.

Virtual bartender, a virtual beer for this good man - on my tab.

Tony

Just don't expect absolutely clear and concise information from the FCC database.

For example, in Las Vegas, you might see several companies licensed for the same frequency, and one, or more, of these companies will have several licenses for this same frequency. Further, after all this, and even checking the FCC web page, you will still not find the name of the actual USER of the frequency. And, no, I'm not talking about a frequency where CTCSS is used -- I'm talking about control frequencies for trunking systems. I mean, how can more than one company broadcast a continuous control on the same frequency at the same time in the same city? Yet, for more than half the trunking systems in Las Vegas, that's what you'll find.

That's not to say you shouldn't get a CD, as they are generally useful. The CD companies just take the FCC database as they get it.

I bought the March PERCON, at a fair price, and with fast delivery. But I still frequenty have to check some things with the main FCC database online, and with POLICE CALL. And, even then, I often can't find the actual user of a frequency.

Another book to add to your scanning library is the Southwest Frequency Directory by Dan Rollman. It is very concise and accurate and it covers the whole state of Arizona (which makes it good for trips to Flagstaff or Tucson, etc.) It costs $20 and I think it's worth every penny. You can get yours at either Bronco One or Apollo Communications.

FYI: I am in no way affiliated with Dan or any of his products. I don't make any money from him or them. I'm simply a satisfied customer.

Also, take a look at www.mghusa.com/scanner Lots of good scanner links for AZ frequencies, among other goodies. Worth a stop. If you have or want an alpha pager, check out Incident Command Page's site, available from the above link. I think it's another cool toy for scannists here, although I must confess that I'm not a subscriber (no need for an alpha pager right now). But I've heard nothing but good things about their service, so I thought I'd pass that along as well.

Someday soon I'll put up my own site dedicated to PHX scanning. But until then, the above mention items should get you off to a great start.

-Phil

I just finished putting one up today, March 26, 1999. I had a Channel master all band up for one year, I kept it up, but put this other Radio Shack Discone on the opposite end of the house 40 feet away. I went in and set up my radio to the discone, and was getting in stronger signals on the weather band, and the signal is so much clearer without any static. I also switched back and forth, and it was the same. As for the local police they are 453.875 and they use handhelds also on low power. This will be the test to see if I can get them in clearer with the handhelds. I will keep you posted.

With regards to updates, PerCon is now doing it monthly which is
the best you'll find in this particular industry, I think.

As for the owners of frequencies, you're right. These days many
are John Does are buying up either regular or trunked radio
frequencies (SMRs) in 800 MHz and then leasing them to a number
of angencies. So while you know that John Doe is licensed for
the frequency, you have no idea who is leasing the equipment
and use of those frequencies to. Unless John Doe is a personal
friend of yours...;-)

You have an incredibly defective idea of how Usenet works. Every news server in the entire world that carries the newsgroup gets its very own copy of the binary. MOST news servers retain only one copy of the cross-posted article + attachments, linking to multiple newsgroups; some are incapable of this and keep one copy for every newsgroup in the crosspost.

> As for being a .... stupid idiot...
>
> I guess some peple can only express themselves with vile language.
> Maybe I did make a mistake in posting here. I was only trying to
> help. I see no one else offering help.

You did a rude thing and got rude comments about it. However good your intentions might have been, you caused over a hundred thousand machines throughout the world to make over a hundred thousand copies of your binary. The proper thing to do would have been to put them in your web space and post links to them, for future reference.

Let's put it this way asshole. Usenet is NOT restricted to NNTP
services.

It seems that someone as smart as you would realize that if you didn't
want to get flamed for your actions, You'd get the fuck off of the
Internet.

>
>You are not familiar with other ways to access newsgroups are you?

I'm familiar with many ways to access newsgroups. I myself use three
different methods, two of which are the store and forward variety. One
of which is UUCP.

>
>>>Only one binary file is sent to a server.
>>>Each group that the file is sent to only contains links to that one

>longer supported has access to it.

Look at it this way Charles. There are going to have to be a lot of
FUCK YOUS coming fro me to you to equal the bandwidth you have consumed
on accounts of folks not wanting it used for binaries.

There is a reason why there are *.binary.* heirarchies, and that is
so people can download discussion groups without worrying that some
asshole is going to come along and use up all their discussion bandwidth

and/or disk space with binary files.

>Do you have access to a website with 7 megs of space? If so, you can
>post it there.

Sure do. Go to http://www.geocities.com/ and they'll give you 11 FREEEEE
megs of disk space.

>Complain. This was not a warning shot. You could have said this post
>should have been (alt.binaries.????). Instead you start ranting and

5047. IMTS

Newsgroup: rec.radio.scanner
Date: 1999-03-27 00:00:00 UTC
From: Joe Badura <00223899@bigred.unl.edu>
Message-ID: <36FD685C.AA1E4BAD@bigred.unl.edu>
Source record: 123890

The text below was taken from
http://midtown.net/tomfarley/Cellbasics.html
" Many people refer to mobile telephone by just saying IMTS,
which stands for Improved
Mobile Telephone System. It's the newest form of mobile radio.
[2] Most IMTS equipment operates in the UHF band. A centrally
located transmitter and receiver serves a wide area with a
relatively few frequencies and users. "

What is IMTS? What are the Frequencies?

I think our sheriff's department uses it. I have heard the
sheriff's dispatch refer to their mobile phone service as a
"Tower Phone". Also, I have noticed a UHF antenna on their cars,
but the county uses VHF for thier radio comms. I have always
assumed the antenna was for mutual aid with surrounding counties
that use UHF.

I've used one for the last 3 months with excellent results.

I live approx. 30 miles east of Vancouver, B.C. and can regularly (and clearly) copy King County DPS on 154.965, Kitsap County Sheriff on 158.880, and Washington State Patrol in the Seattle area on 155.580. All are repeaterized channels. As well, I get such a strong signal from the Whatcom County Sheriff on 453.325, I actually have to attenuate the signal. Granted they're all probably putting out whopping signals, but still, Seattle/Tacoma is 150 miles south of me.

I'm happy with the RS discone.

Source record: 123898

In Bill Cheeks book, he says to replace the CX-1 crystal with a 3.57MHz TV Colorburst crystal. I have done the mod to a couple of 2022s and a Pro-34 with good success on all of them. I got the crystals from a TV repair shop for around $4-5 a piece. The crystal it replaces has three wires while the Colorburst crystal has only two. Another wire is soldered to the outer case of the crystal and is used as the middle wire.
Radio Shack shows this same crystal in there catalog, but when I tried to order it, they told me it was no longer available. Figures!
I've never seen information about this mod on the Net anywhere, so I can't help you there, maybe someone else can help.

Good luck,
Brian

I do not agree.

The so called invalid auctions are only happeningt to cell "scanners".

If they are using RDBMS technology and I would bet thatthey are, it is much easier to delete
the actual page entry than to remove listing from the search entry. Most likely, the entry is probably a compund primary key which is not that easy to remove from the indexex. That would breech the structure of the database.

The circuit diagrams for this scanner, once scanned in, occupy 3 or 4 MEGS per scan, and it takes probably 8 or 10 scanned images to cover the entire diagram. Do you really want to do this ?

I will attempt to answer all of the flames in this one message. I posted here because it seemed to be an easier way for people interested in scanner software to find the program. It is a "scanner" discussion group. I have not seen a scanner binary group.

As for it taking 20 hours to download...

You must not be very smart (or whatever profanity you prefer to use) to download everything that is posted. there is a reason software allows you to download headers. Even to download the program would take less than an hour. I would not want to even waste an hour downloading something I did not want so I only download headers and select messages I want. Only one binary file is sent to a server. Each group that the file is sent to only contains links to that one file. Space is not wasted and others have access to the file.

As for email...

Most people can not accept email over a certain size. This depends on the service you use.

As for being a .... stupid idiot...

I guess some peple can only express themselves with vile language. Maybe I did make a mistake in posting here. I was only trying to help. I see no one else offering help.

> that end in 5hz, eg; 891.435, 891.425, 875.285, 878.765 etc.

While the 5 KILOHERTZ will get you within the pass band for
reception of thse signals, I think the problem here is that
you are using 5 kHz steps in a 12.5/25 kHz band. On the 2006,
make sure the step size is set to 12.5 kHz. On the AR8200,
make sure it is 12.5 kHz or 25 kHz with a 12. kHz offset.

> Is there something wrong with these scanners?

No.

> Are the cell radios/telco base transmitting "off frequency"?

Possible but not the first explanation to justify this.

Strong Signals,
Rich Wells N2MCA

It is possible they are canceling because of scanners that can receive
cellular comms.

They claim that it would be "illegal".

5075. Ebay says YES to PORN, NO to cell scanners !

Newsgroup: rec.radio.scanner
Date: 1999-03-27 00:00:00 UTC
From: scanshack@aol.communicate
Message-ID: <19990327093750.08410.00000690@ng43.aol.com>
Source record: 123951

Ebay says YES to PORN, NO to cell scanners !
Think about it.....who would you want to babysit your kids ? A non-perverted scanner owner who bought a cell capable scanner or a person who will never own a cell capable scanner (heavens forbid, its against the law !) but will agree to the below and enters the world of the Ebay OK to view, buy or sell porn items ?

EBAY Terms of Use
Erotica, Adults Only Category
("Terms of Use")

The pages for the Erotica, Adults Only category may only be accessed and used by responsible adults over the age of 18 (or the age of consent in the jurisdiction from which it is being accessed). Materials available within this category include graphic visual depictions and descriptions of nudity and sexual activity. Federal, state or local laws may prohibit visiting this adult category if you are under 18 years of age. By entering your User ID and Password to access this site, list an item, or bid on an item in this category, you are making the following statements:

1) I am a member of the eBay community and I will follow the eBay User Agreement governing my use of the eBay web site.
2) I am willing to provide eBay with my valid credit card number and expiration date, which will be left on file with eBay in order to verify that I am at least 18 years of age.
3) I will not permit any person(s) under 18 years of age to have access to any of the materials contained within this site.
4) I am voluntarily choosing to access this category, because I want to view, read and/or hear the various materials that are available.
5) I understand and agree to abide by the standards and laws of the community in which I live or from which I am accessing this site.
6) By entering my User ID and Password and viewing any part of this adult category, I agree that I shall not hold eBay or its employees responsible for any materials located in the adult category, and I waive all claims against eBay relating to materials found at this site.
7) If I use these services in violation of these Terms and Use, I understand I may be in violation of local and/or federal laws and am solely responsible for my actions.
8) I am an adult, at least 18 years of age, and I have a legal right to possess adult material in my community.
9) I do not find pornographic images of nude adults, adults engaged in sexual acts or other sexual material to be offensive or objectionable.
10) I will exit from this site immediately if I am in any way offended by the sexual nature of any materials on this site.
11) By entering my User ID and Password at the bottom of these Terms of Use,

and by listing, bidding an item, or entering the adult site, I agree to abide by these terms.
12) If you do not agree to these terms, click on the back button of your browser and exit this adult category page.

PS I clicked on the back button of my browser !

When you're discussing someone using an online reader, sure, but when
talking about an offline newsreader or a UUCP system, you don't know
shit! Don't assume that everyone uses the same software you use.

>Even to download the program would
>take less than an hour. I would not want to even waste an hour
>downloading something I did not want so I only download headers and
>select messages I want.

You are not familiar with automatic operations, are you?

>Only one binary file is sent to a server.
>Each group that the file is sent to only contains links to that one
>file. Space is not wasted and others have access to the file.

Instead, you waste space on every single news server on this planet.

>As for email...
>
>Most people can not accept email over a certain size. This depends on
>the service you use.

Then put it up on a web page and tell people if they are interested, to
download it from there.

>As for being a .... stupid idiot...

We hope there is help for you. If not, you will remain a stupid idiot.

>I guess some peple can only express themselves with vile language.
>Maybe I did make a mistake in posting here. I was only trying to
>help. I see no one else offering help.

So was I. I could just as easilly have complained directly to your
ISP but I assumed that you would have wanted a warning shot first.

Hello all. I am new to newsgroups and all so I hope this works I have a midland model 70-245 bmx 5 watt handheld radio. covers 450-470 mhz has 16 channels and is capapble of gmrs frs ect. CTCSS board is installed and there is a mod available for user programming, however as far as I know it has not been done on this radio.
Radio is complete with antenna, belt clip, good battery and dual rate charger. I will throw in a carry case at no charge. My asking price for this radio is $150. or will trade for nice SSB CB radio. that is modified for extra channels or is modifiable. I would like a 148 gtl-f or something similar . hr 2510 or something along those lines. Please email pcmedicnj@yahoo.com and make offers. Please do not reply to board. Thank you all for your time in reading this.

Different staff, different lawyers, different policies. Also, Uniden makes phones, Opto doesn't.

I think you're right, though, about this coming down to what information is available via each method of decoding. I don't know that much about the datastreams on a SMR, so I can't do more than speculate on that.

And that is what you do by your constant complaining too. If this
program was posted to a binary group it would have been on every
server. Wasted? At least someone that wanted a program that is no
longer supported has access to it.

>
>>As for email...

Complain. This was not a warning shot. You could have said this post
should have been (alt.binaries.????). Instead you start ranting and
raving posting language that may be seen by minor or others that do
not appreciate your language. Hmmm, should this be a warning before I
easily complain to your ISP? I am not saying that I did not make a
mistake by posting to the wrong group. I am saying you could express
yourself better.

While we are on the subject, is this the right newsgroup for this
discussion??????

Your help is mis-directed Help those that are asking for it. Explain
what others may have done wrong without acting like you own the place.

Here's some email from eBay which y'all might find interesting:

=== BEGIN QUOTE ===

Please be advised that the following auction in which you were a
participant:

81081635 - ICOM PCR-1000 (UNBLOCKED) with DSP

was ended early by eBay for listing violations. All results for this
auction are null and void. If you proceed with the purchase of the
item,
you do so at your own legal risk and may be engaging in an illegal
transaction; therefore, you as a bidder are not legally required to
complete the transaction.

Regards ,

Sourinda Soudachanh (ended@ebay.com)
eBay

=== END QUOTE ===

There you have it, straight from the horse's mouth. eBay must have
some really shitty lawyers, as it is NOT illegal to sell such scanners
USED, only to manufacture and import them NEW. Yet here they are
telling people that they have no legal obligation to honor their bids.

In any case, I doubt this will stop cellular-capable scanners from
being sold on eBay; people will just stop advertising it blatantly in
their item descriptions.

Antenna range depends on antenna HEIGHT, and how clear it is of local obstructions (hills, tall builings, etc). and much less on factors like the specific antenna used (disegarding beam antennas), and the quality of the coaxial cable used to carry the signal to the radio.. You are not going to garner much "gain" out of a vetical antenna that is a non - beam type. On the other hand, amplifiers usually amplify noise as well, so you just about stay the same, since they degrade the rig`s signal to noise ratio....

John Moran wrote in message ...

You know, all you people that do all the bitching about the Mackey thing just contribute MORE garbage to the group. Every couple of days, i have to wade through a bunch of posts that go like this:"I can`t return to the group because this is still going on". What is the matter ? Your damn browser doesn`t have filters for your news groups ? Then dump it, and get one that DOES have filters. THEN, USE THE FILTERS. I have stayed right here and filtered the garbage out for a couple of years. YOUR only problem is, you are just too damn NOSY to turn your filters on and leave them that way !

Here are some tips for you: When they mention the debate (Whether they are whining about it or participating in it) FILTER THEM OUT BY THEIR POSTING ADDRESS. Don`t filter them out by the subject line of the message, that won`t last. As soon as they start a new thread, you will see them again. People have been whining and crying about this for years, and it has done no good at all.

If you don`t want to take the time and effort to filter it out, then for Christ`s sake , stop crying about it. If you want to leave the damn news group instead of learning how to use your filters, then go ahead. It is no skin off my nose or anyone else`s. You couldn`t have been all that interested in the first place The great Mackalooney debate will never end until you stop paying attention to it, and stop legitimizing it by talking about it and whining about it.

5097. A Filter Primer For Outlook Express

Newsgroup: rec.radio.scanner
Date: 1999-03-27 00:00:00 UTC
From: Zombie Wolf <zmbwf@somtel.com>
Message-ID: <7dj9da$h2r$1@garnet.mint.net>
Source record: 123973

OK, so here is some info on just how to use your filters in Outlook express, and get the best effect from them to filter the garbage out of ANY news group.

1. You see an post from the looney, or one of the participants.

The first impulse in this case, is to filter using the subject line. This will NOT WORK. Let`s say we have a post with a subject like this:

WAAAAAH ! The Debate isn`t over !

So we say:"Ok, I will just filter on the WAAAAH part of the title". Next day you see a post from the same guy, with a new subject line:

I`m gonna tell my mommy !

Why didn`t it work ? Because WAAAH isn`t IN the subject line of the new message ! So your filter merrily let it pass !

Here is how to do it and make it STICK

1. Highlight the message from the guy you don`t want to see any more.

2. Right - click on the message, and choose "Properties" from the drop -down menu that appears.

3. Find the "From:" line in properties (From:prozac@tiemedown.com)

4. Double -click on the posting address that follows it. It will now be highlighted.

5. Right - click on it, and choose "Copy" from the drop - down menu. You have now copied his posting address, which doesn`t change (in most cases)

6. Close the Properties box

7. Click on tools, in the menu at the top, and choose "News Group Filters" from the drop - down list.

8. The News Group Filter window appears. Choose the "Add" button

9. Right -click in the From box, and choose "Paste" from the drop - down menu. This will paste his posting address into the box..

And now, a word abbout bullets: you know, the "<" and ">" at the ends of some posting addresses.

<oldhat@letitgo.com>

If you see these at the ends of the address after pasting it into the from box in the filter, you will have to edit them off the ends. They will prevent the filter from working properly. Just use the backspace key or delete key to get rid of them.

When you get back into the main program, click on "View" at the top, and if the "Filtered Messages" line has a check, then remove the check. When the check is removed, the filter is on. When checked, the filters are OFF. (Seems backwards, doesn`t it ? But that is how it works !)

You will notice that his message(s) suddenly dissapear from the list, and you go back to the top of the list. Now, when you scroll through, you don`t see his posts any more ! He can now post all the garbage his little heart desires, and you will never see any of it ! Unless he changes his posting address, he will stay filtered !

If he DOES change it, then you just go through this process again, and add him on again, leaving the old one intact. (Some people think they can thwart filters by using multiple posting ad`s, but you can use this method to get them all).

You will have to go through and do all the ones you don`t want to see any more. And, you will sometimes have to add on a new one. But after a short time, you will get it under control, to the point where you don`t see much of them any more. This worked on the Looney - Tune for over TWO YEARS at a stretch, so I have already tested it for you !

Scott, eBay has ended item 81081635, from your link below.

It looks like some have come back, but without the wording
"cellular-capable."

eBay gets rid of firearms & certain type of radio scanners, but keeps the
prono. Tells
you alot about the people who is running eBay.

have you tried using the tone board to reduce the pager interference? If you know your police or fire department's PL tones, you can cut down significantly on the amount of pager interference. That is, of course, if they use CTCSS tones. The 895 can not decode DPL, which really sucks! Hope this helps.

5116. Ebay IS still removing cell scanners !

Newsgroup: rec.radio.scanner
Date: 1999-03-27 00:00:00 UTC
From: scanshack@aol.communicate
Message-ID: <19990326200659.25475.00000695@ng11.aol.com>
Source record: 124007

I just checked out some of the scanners listed on ebay that are ending in the next 24 hours and it looks like they are shotgunning their choices of which to keep and which to remove. Some that say no gaps or receive cellular show up as listed then when you select the item it shows as invalid.
Then I checked some that are new today and the same thing. Some they left on and some show as invalid when selected. INVALID = REMOVED !!!
I wrote to ebay and got a reply but it makes no sense as they instructed me to see the illegal and infringing site area. Guess what, scanners are not listed there so where is this decision coming from ???
Below is my e-mail to them and their reply.

Original message follows:

Date: 3/23/99 8:12:38 PM Mountain Standard Time
From: scanshack@aol.com
To: Support@eBay.com (eBay Customer Support)

Hello,

There has been some talk in the newsgroups that ebay is not allowing the sale of radio scanners that are capable of receiving the cellular telephone frequencies. I have noticed that some of the scanner auctions that did advertise this function have been stopped prior to the end of sale time the past day or two.
Is this a new policy that will be enforced ? Will these items be added to the list of illegal items to post ?

Thank you for your time.

Below is their reply:

Subj: Re: Question on items recently being taken off auctions ? (KMM679262C0KM)
Date: 3/24/99 10:23:38 PM Mountain Standard Time
From: Support@eBay.com (eBay Customer Support)
Reply-to: Support@eBay.com (eBay Customer Support)
To: scanshack@aol.com (scanshack@aol.com)

Hello,

Thank you for writing.

If you are not sure about listing an item on the eBay site, please visit our new illegal and infringing site at the following URL:

http://pages.ebay.com/aw/help/topics-png-items.html

If we can be of any further assistance, please let us know.

Thank you for using eBay!

Regards,
Tiffany

5117. 800 MHZ Band Plan Question ??

Newsgroup: rec.radio.scanner
Date: 1999-03-27 00:00:00 UTC
From: joegizjr@aol.com
Message-ID: <19990326202924.13532.00000642@ng28.aol.com>
Source record: 124008

Folks,

I noticed in the published band plan for cell freqs for the Telco (base) transmission side that they all end in 0 hz, eg; 891.420, 875.280 etc.

However, on my RS2006 and my AOR8200 I am picking up transmissions that end in 5hz, eg; 891.435, 891.425, 875.285, 878.765 etc.

Is there something wrong with these scanners ? Are the cell radios/telco base transmitting "off frequency" ?

Or possibly, is 5hz and acceptable tolerance for this band ?

Any insights will greatly help ....

73's

Joe

Not 5hz, but 5Khz, and it's probably an acceptable tolerance for this
band. Especially in a populated area there will be nearby cell towers
with very strong received signals which the scanner will lock onto even
if they are slightly off-center.

>there so where is this decision coming from ???
I've been selling on eBay(tm) for sometime now. eBay(tm) has received much
flack from athorities in regards to illegal items being sold on eBay(tm).
However eBay(tm) will not "on their own" delete, cancel, or end an auction
early as they themselves do not go through all 1.8+ million items listed
forsale. However, they do act (swiftly I might add) if another eBay(tm) member
reports an item as being illegal to eBay(tm). I'm sure there are some
self-proclaimed eBay(tm) policemen protroling the radio section looking for
these items. I've been a victem of this, so therefore I will not list radios
forsale on eBay(tm) any longer. I'll stick to selling gambling software which
I make the most profit at anyway!

If its not some selfproclaimed eBay(tm) policemen (ie:internet user which as
something against people with scanners and has nothing better to do with their
time) it might be people within the cell phone industry. These jerks will do
anything to keep the Cell phone industry alive, including stepping on your
rights as a citizen.

If you want to check out a great radio website, check out mine. I have very
current Kosovo frequencies for you HF/SWL people. Plus I have lots of scanner
stuff too! The url is http://www.flash.net/~av8tor/radio

I also have an editorial on Cell Phone at
http://www.flash.net/~av8tor/radios/celledt.htm

Thanks,
George

>I searched for scanner and cell but all 12 auctions that I clicked on
>were "invalid". Why the big crackdown?

The "crackdown" doesn't appear to be all that huge - here's one that's
still current:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=81081635&tc=search

There are others that were still active when this "crackdown" was
first reported, but ran to completion, e.g.:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=80223323&tc=search

On the other hand, I've had varying amounts of trouble connecting to
those and other links recently - sometimes it takes 3 or 4 tries
before the link will come up correctly. Perhaps the bad references
others are seeing are merely some sort of system failure? One would
expect that, if an auction were REMOVED, then it would be removed from
the search indexes as well.

I have an AOR 8200 full cell coverage for sale. You will not find a better price on this model anywhere. Scanner was used for approx. 1 week. I still have original bill of sale that shows my cost of $859 CA + 7% tax =$920 Canadian dollars.($605 US)
My price for this is $490 US or $740 CA. You will need to pick up the shipping for that price.

Included is the following: AOR 8200 Scanner
Premium AOR vinyl carry case (worth $16-20 US)
4 ni-cad batteries
12v cig. adapter
Scanner is guaranteed new condition complete with 1 year (less 3 weeks) warranty which will be transferred to you.
Do your homework then save some cash. Same day shipping....
I am in Ontario Canada to give you an Idea and the shipping weight is 2.25 lb. size is8" x 10" x 3"

Anyone know of any pending scanner technology to monitor
digital cellular?

I monitor thru a modified pro-51, still going strong.

I've read that scanner makers are looking at the costs
& legal marketing of digital receivers.

AM-FM will be all digital within 7 years, as will TV.
But costs will be significantly lower by then.

I enjoy monitoring cell calls, but I know the technology
will change...so just curious if anyone knows of any
pending scanner changes ahead?

I work in media. Thanx to all!

Currently it could cost as little as 1,000 (surplus) - 4,000 (new) $ per RF band. That is, you would need one radio each for VHF, UHF and 800 MHz. Digital two-way radios can be purchased new or surplus and programmed to operate non-trunked on the frequencies. You couldn't do a "search," but you can scan a few (in the case of the Motorola Astro products, up to 16) analog and digital frequencies. $30,000 is more in line with test equipment where the frequency can simply be punched up on keypad. Test equipment usually has much more limited "scan" functionality, but it much more functional in all other areas.

I have trouble connecting to eBay to. I did a search on AOR and came up
with some items. When I tried to check some of them I get the message
Item "##########" is invalid or could not be found. So, eBay telling me
that I entered the item number wrong, yea right. All I did was clicked
on the item in under the AOR search page. I don't think they have
a clue what's going on. I'm also able to get to some of the enable
cellular scanner item pages to.

5147. Great NH Fire Freq.-Need Primary

Date: 1999-03-28 00:00:00 UTC
From: ACCC <anton8@currencyandcoins.com>
Message-ID: <7dlcqu$7td$1@remarQ.com>
Source record: 123836

Hi all, Any body in the southern part of NH and perhaps Northern Mass. may want to plug in 461.400 and 462.125. Gives out information on all ongoing fires in the state of New Hampshire, Maine and Massachusetts along with up to the minute updates. Really is awesome. My question is this. They have a new primary frequency that is close to the Londonderry Police Frequency. I cannot find it after hours of searching. Does anybody have this frequency? Also what is the group that I am monitoring as they seem to go to these fires? Any info would be appreciated. Reply dierect or post. Thanx, Tony

For cellular phone bands yes, 12.5/25 for business/public safety.

And then have it confiscated when trying to import it like my uncle in Oregon, now he is out almost 350.00. Great idea, if you can get away with it. The only true way to get a UK scanner in to the U.S. without raising any suspicion is to have somebody in Canada receive it and then send it by UPS to the States. I have done this for three cousins now without a hitch. It is not illegal to have a cell capable scanner in Canada and UPS doesn't care when it crosses the boarder from Canada to the U.S. If only my Uncle would have talked to me before ordering, but I guess that's how it goes. My advise is to get to know somebody in Canada and go that route, if you have to have a new one. My observations anyway.

I would have sent this by email but you seem to have used the Deja News to post your ad. I will offer $650 for the radio if it is in the condition you say it is in. I justify that offer by the fact that your radio has no optional equipment installed. I do see that you said FIRM after the price but you may change your mind later. The only thing that would set your radio apart from all the others being offered for sale is the condition that it is in. Also I would need to talk to you on the phone and get a few references. No insult intended, I am just very careful as to who I send money to.

Mel, Dan is not totally correct in his reply. Morse code(CW) is used in the Amateur and commercial bands. While it isn't the favorite of most radio operators, it continues to be a requirement for the majority of the Amateur licenses world wide.

You can find code practice being sent by the Amateur Radion Relay League. If you go to their web site: http://www.arrl.org/w1aw.html your'll find their schedule.

Hope that answers your question.

Best of luck with Morse Code....

Mike

<milhouse@bigfoot.com> wrote:

>With many agencies switching to digital is radio scanning going to be just
>as fun as it used to be????????/

Well with the soon-to-be Ericcson Trunktracker, and in light of the
long-standing Motorola-oriented Trunktracker, it should be clear that
trunking alone won't mean the end of scanning on the wild. However,
digitalization will be an entirely different animal. Consider that
public safety communications will move from radio to non-radio
methods. Digitalization is NOT radio and so when a department goes
digital it's effectively gone to a closed wide-area "telephone"
network. The equipment for intercepting digital telephone
conversations is expensive and any current technique of interception
can easily be thwarted by a ten minute change at some computer console
down at City Central.

We'll all be free to monitor the usual "radio" frequencies, but what
will be left there won't be very interesting or useful. The strength
of the scanning hobby may well rest on the enticement level of the
last remaining industries to consistently use radio communications. A
lot of people like listening to airline traffic, marine, or ground
transportation operations. I personally suspect these will be the
last modes to adopt completely digital communication infrastructures,
though here in Tampa you can't listen to Yellow Cab anymore because
they rely more on MDTs than conventional radios.

There's no doubt that individualized scoping of the local radio
spectrum is a lot more fun and spontaneous than the technologically
controlled world of public safety we are about to sail into, but it is
reality. One thing we should all be doing as scannerists is promoting
the positive aspects of our hobby and reminding public safety that to
a large degree it was a GOOD thing people could listen in. When
digital systems go up they should have some compensation: Access to
the same radios police use, access to MDT traffic via the internet,
access to the same dash-cam videos present on police cruisers
(possibly transmitted over cable channels), etc. and so forth.

As always, I preach this at my website:

Hi folks,

I'm looking for some detailed information on the Federal / Military
Trunking systems in the DC Metro area for posting on my SE US Trunked
Radio Information Homepage.

http://web2.airmail.net/lblant1/trunked.htm

There are numerous Federal Trunking systems in the DC area that
operate in the 406-420 Mhz band, including FEDSMR and a few others.

Can anyone in DC area help shed some light on some of these systems?
I'm specifically looking for LCN freqs, talkgroups and users. I'll be
posting the info that I receive at
http://web2.airmail.net/lblant1/trunked/dc.htm

Many thanks!

I bought a Bearcat 300 (for $32.50) at an estate auction recently,
and, while I can do simple things (like entering a new memory
frequency) with it, I can't search, nor have I been able to deduce
what some of the buttons do.

In particular, how do I use the UHF, HI, LO, LIMIT, SEARCH, AUX,
and COUNT buttons?

A pointer to an on-line instruction manual or a source for a hard-
copy manual would be greately appreciated.

That's funny.... these are the scanners that both amateurs and pros want and will pay appropriately to get. I think I've seen one for sale at all the hamfests I've attended over the past 5 years. They will receive just about anything VHF and UHF has to offer. I love my 2004 and wouldn't part with it for the majority of the junk made today. Even at today's prices they are cheap compared to what they will probably be selling for five years down the road.

Guess we all "aren't really all there"...

Message-ID: <7dm44b$c1q$1@pacifica.access.ch>
Source record: 123861

Hi,
I hope my question is not too much off topic.

I'm looking for a free-/shareware program and/or source code in any language, that would help me to encode and decode DTMF signals; coding schemes like CSSTC or others are equally welcome. Operating Systems can be: DOS, Win 95 or Linux. I know that there some excellent programs around like WinTone etc., but they don't fullfill all my needs. I'd like to encode plain text files into WAV-files (or send the converted code directly as sound output) using my SoundBlaster 16-bit card. Incoming sound or a WAV-file should equally be decoded (through FFT, I suppose) into ASCII text and saved as a file.

I looked around in many software collections of commercial products and shareware archives, but I didn't find this kind of program or source code. I'm not able to write it from scratch on my own, but I think I could adapt some programming code, if I only had the core functionality (SoundBlaster programming, WAV-File reading/writing, and FFT frequencies extraction). Can someone help me or point me to a solution?

Many thanks in advance

If anyone is anxious to unload this trunked radio, thought I'd check here before giving my hard earned cash to Radio Shack. Please e-mail me if you've got this radio and need cash fast! Sale on this at Radio Shack ends 4/3.
Thanks!

Uh...if a number of buyers and sellers agree and make deals on certain
items clustering around a given price, that IS fair market value.

The 2004-2006 have obvious advantages which knowlegeable people are
willing to pay for.

For best results on the 43-47mhz range (cordless phones) extend the top section all the way and then back off on the top section only, do not even extend the lower portion below the coil at all.

Hey ! Guys! This is exactly the kind of post that attracts the attention of the very people who will confiscate your scanner. This is NOT a private message board. And it is accessible to both the authorities, and the legislators who decide what the authorities will act upon. You want to keep the governments out of the hobby? Then don't discuss evasion of the current laws. C'mon.

I have 100 ft. of RG-8 cable which has been sitting unused, out of the elements for about 10 years. I inspected the whole cable and except for where the connectors are I can find no sign's of "cable trauma". Do I really need to throw out all 100 ft. of cable because of its age, or would cutting 5-10 ft. off the traumatized ends make it still usable? It was previously used for 5 years in an area af Calif. which gets no snow, rarely falls below freezing, nor endures blistering heat.
Your thoughts?

I get 5-7 hours out of batteries, depending on what I'm using. I use alkalines, ni-cads, and ni-mh. Good life from all of them.
By all means buy one, great LITTLE radio for the price. PC programable with freeware.
Well worth the money.

I am debating purchasing the BC890 or 9000XLT because they have the optional CTCSS board. It seems to me that this would benefit scanning particularly for a lot of UHF freqs that border GMRS. Is it a worthwhile option?

What type of dielectric material is in it? If the center conductor is
surrounded by a semi-clear hard plastic type core it _may_ be OK.

If it is any type of white, soft foamy material, it is better used as
a mobile power cord. Makes a great hash filter. Just ground the shield
at both ends. The longer the better. Coil some up under the seat or
some such.

Good signals... LCM

When you cut the ends off the cable, if the copper is still shiney,
it should be ok. I had some up for several years and it layed
around for another 10 years and by measuring it, the losses seemed
not to be any greater than when new. Not sure where the people get
that old cable goes bad. Maybe it does, or maybe I am just not
seeing it on a couple of pieces that are over 20 years old. That is
measured losses at 440 MHz with a dummy load and Bird wattmeter at
about 100 watts input.

Hello, I used to have a listing of frequencies by cell. You could listen and find one or two frequencies using search and then look at the cell lists and determine which cell you were listening to and then program all the other frequencies in that cell individualy and not have to scan the whole spectrum.
Anyone know where to find this information?

Anyone have an old (but working) 10" B/W VHF-UHF television set with
an analog tuner which they want to sell anyway? You might try selling
it on E-Bay while promoting its capabilities to tune into the frequencies
where cellular calls currently exist.

Be carefull on the wording though. Don't say it tunes into cellular calls
or anything like that. Simply state its channel range and then perhaps
in brackets "[channels 70-83 are currently in use by cellular phones]".

I wonder how far they'll go.

Does selling by a US based person to a US based person consist of
"importing"?

Does selling by a foreign entity to a foreign entity require that it
be legal in the US?

Hello,

Uniden BP2500 battery pack, I modded it a bit.

Just wanted to share a bit of info. I got bored today so I decided to open up one of my three BP2500 battery packs. One that did not hold a charge. After opening it I did a bit more.
Now my BC2500XLT can be powered by 4 AAA batteries.
Should work for a BC3000XLT also as they use the same BP2500 pack.

Are you sure it is splatter? I bet it is intermod. If you are close
to a hill top that has a lot of differnt repeaters on it, you will get
the sum and difference of two unrelated frequencys show up on your
freqency. It sounds like splatter but most likely isn't. A triple
conversion is not any good if the front end of a reciever is weak or
has bad selectivity. I have several double conversion scanners and
they all suck were I live and I have several triples as well and I
still get intermod. I live in metropoliitan L.A. and being here is a
real test of any rig. Burbank is the worst place, we call Burbank CA
intermod hell. Even ham radios get trashed in burbank and Ham HT's
can be trashed in some areas. Usally Ham rigs have better selectivity
due to their more specific recieve tuning. Try sticking a rubber duck
on the scanner and see if some of the trash goes way.

eBay gets rid of firearms & certain type of radio scanners, but keeps the prono. Tells you alot about the people who's running eBay.

IMTS is an OLD form of analog mobile telephone, operating in the 152 and 454 MHz ranges. It predates cellular by many years. Must have been an old article.

Joe Badura <00223899@bigred.unl.edu> asked:
> What is IMTS? What are the Frequencies?

From the FAF - Frequently Asked Frequencies
on Compuserve / Hamnet / Lib 2 / FAF.TXT

Mobile Telephone [22.501]

VHF - 30 kHz spacing UHF - 25 kHz spacing

Base: 152.030 - 152.210 RCC 454.025 - 454.350 RCC
152.510 - 152.810 telco 454.375 - 454.650 telco
Mobile: 157.770 - 158.070 telco 459.025 - 459.350 RCC
158.490 - 158.670 RCC 459.375 - 459.650 telco

Transmissions are FM. Many of these channels may now be used
for paging, specifically 152.78, which is a nationwide page.

Check out item #81424364

It's a cable box "test chip" auction which they haven't pulled, and
do we all know what a "test chip" does?

Here's another idea to go along with my "unblocked UHF TV" idea for
an auction item... cut a piece of hanger to 1/4 wavelength of the
cell phone freqs and mount a BNC connector on the end... make it look
fancy if you want, but make sure it is tuned for the cell freqs, then
have no shame, but put it up for auction as:

Special home built CELL FREQUENCY scanner antenna. 1/4 wavelength
scanner-mount antenna. No need to run wires outside. This
antenna is specially built to receive the cellular telephone
frequencies. This antenna is equiped with a BNC connector to
mount to YOUR scanner.

Yes they do use PL tones and that reminds me that I need to add Beverly Hills to my homepage. The standard tone which they use is 131.8 for Channels 1-6 and the Mutual Aid Channels 1-5, use a tone of 186.2. The Fire Department uses 156.7 for channels 1-4. If you need any other PL's for BH freq's, email me. Hope this is what you were looking for.

Hey Mel,

Just a guess, but may be worth a shot:

I occasionally cross some Morse Code in
the longwave bands here by the Chesapeake
Bay...also on some shortwave frequencies.

I know the code is now obsolete & pretty
much extinct, but a few antiquated stations
left the transmitters on. You might get lucky.

Cross-posted to: rec.radio.scanner,alt.radio.scanner,phl.scanner,rec.radio.swap

I agree that people who pay such prices for old scanners like these aren't really all there. There are serious issues like caps that are doomed to failure with age and LCD displays that darken and fail with age which will render the scanner useless until repaired.

Add the anticipated repair costs, the lost
of the use of the scanner while being repaired, and subtract that from what you think
a comparable scanner would cost to get a fair market value.

To pay more then fair market proves PT Barnum was right when he said there was 'one born
every minute'.

BTW those obsolete scanners are relatively lo tech compared to what can be bought today, especially if you buy a scanner off shore of the USA. Because they are lo tech you might end up with one where some wannabe technician got inside and tried to modify the unit. A lot of the 2004 -6 scanners have this problem. There may be anything from cold solder joints to crazy stuff like he used acid core solder or a 300 watt iron. If you are dead set you just have to have one of these I would look very carefuly on the inside before offering any money at all and I would never buy one blind over the Internet!

Actually, the only people whom the general public are annoyed with are, the geek with his scanner crank wide open with the local PD and/or FD blasting out. Someone, who is trying to project an image of importance because the have one or more of the following strapped to their belts; scanner, pager, cell phone and 2 meter radio . Other wise for the most part they do not know you exit as stated by another poster whom said cell phones have made it acceptable.

Hello all. I am new to newsgroups and all so I hope this works I have a midland model 70-245 bmx 5 watt handheld radio.covers 450-470 mhz has 16 channels and is capapble of gmrs frs ect.
CTCSS board is installed and there is a mod available for user programming,however as far as I know it has not been done on this radio. Radio is complete with antenna, belt clip, good battery and dual rate charger. I will throw in a carry case at no charge. My asking price for this radio is $150. or will trade for nice SSB CB radio. that is modified for extra channels or is modifiable. I would like a 148 gtl-f or something similar . hr 2510 or something along those lines. Please email pcmedicnj@yahoo.com and make offers. Please do not reply to board. Thank you all for your time in reading this.

As noble as you think that sounds, you have actually broken a few "unwritten" usenet rules, the foremost being that you should not post (especially x-post) binary files to a non-binary group. Binary newsgroups typically have "binaries" in their description or in their actual name (eg the alt.binaries.* hierachy).

And you will often find such clauses in the Terms and Conditions in the charter of your ISP - and depending on your ISP this may cause you to lose your account, or at least warrant a warning and a rap across the knuckles :-)

Hopefully you have learned for next time :-) Put the file on your site or post the original link or e-mail it. Or as a last resort, post it to one of the alt.binaries.* groups (alt.binaries.ibm-pc maybe) and say that is where you have placed it.

BTW, my offline reader (ie download then go offline) didn't have to choke on your files as my ISP filters binaries from non-binary newsgroups on their news server. Many ISPs now do this because of people posting binaries to a non-binary newsgroup.

Hmm... You're right, if it weren't for these two posts, the customs
inspectors would never have thought to inspect packages coming into
the US, especially packages from companies known to be selling radio
equipment. Now we've gone and spoiled everything.

C'mon! ;-)

There are Canadian scanner dealers who "guarantee" that their
shipments of cellular-capable scanners will make it to you without
being seized. They say so right there on their web pages for all,
including the authorities, to see. Clearly this sort of thing goes on
all the time, and our discussing it here isn't going to affect the
situation one little bit.

Oh, and to any legislators or other government officials reading this:
now that I've got your attention, may I respectfully suggest that the
best way to protect the privacy of the American cellular-radio-using
public is to legislate the use of strong cryptography by all cellular
service providers. Please, forget this ridiculous and unenforcable
ECPA crap; impress us by enacting some legislation that's actually
useful.

Just MHO. ;-)

Anyone using HT's that require high current usage "AA" must use Nickel metal Hydride cells. The don't exhibit memory and full charge in 3 hours. One set in the radio - one set charging and you'll be OK. Do a search on the Internet - I bought mine (NEXcell- 1400 mAh) for $2.25 a cell. Don't buy RS. Get a Maha charger/conditioner for about 20 bucks and you are ready.

Mary,
A good choice is a discone (comes from disk and cone as the shape of
the antenna is like a disk on top of a cone), and as luck would have
it, a company named Diamond makes a very nice one. Soooo, you can
also give him a 'Diamond' this anniversary.

Amateur Electronic Supply (AES) or Ham Radio Outlet sells them, url's
shown below.

http://www.hamradio.com/
http://www.aesham.com/

Expect to pay about $100.

Good luck and Happy Anniversary,
Howard

Agreed. More than likely, the buyer did not properly charge the
cells to break them in. Even the low capacity AAs supplied will
last well (unless you're into pegging the volume). Alkalines
and higher capacity NiCd/NiMH will do a GREAT job (NiCd=1200mAh,
NiMH=1500mAh).

I think the bigger issue here is that some don't properly install
the cable...as in properly sealing connections which are exposed
to the elements. Over time, connections and water inside the cable
can degrade performance. If all connections are properly sealed
and it can stand up to UV, then you should be all set for a while.

> had the scanner. Should I continue to recharge the batteries or should I
> get new ones?

More than likely, you'll have to replace them. Charge them to what you
think to be full charge and then give her a spin. How long do they last?
If they're NiCd cells and they were left sitting around that long, the
chances are good that they won't hold much or any charge. You could
try reconditioning them with a special charger but at that age, it
might be more work and expense than you're willing to spend.

> Also, does the scanner memory get erased if the batteries are
> removed for a certain period of time?

Depends on the radio. Some have non-volatile EEPROMS that don't need
voltage to retain their contents. Older models used a charged capacitor
to hold memory from anywhere from 1 - 30 days.

> stuff?

Skip the PRO-74. SC150 is OK but you should highly consider the RELM HS100/HS200 or the more expensive Racing Electronics RE2000Alpha. A not too bad choice is also the RCA RP-6198 which is harder to track down but worth it since it comes with headphones, splitter cable, two antennas, etc.

There are three companies on the net which cater to this area and make their own modifications to the radios they carry to boost their audio output and battery capacity:

http://www.racescanners.com/
http://www.racingelectronics.com/
http://www.racingradios.com/

They'll also be able to recommend headphones, frequency lists, etc.
Best of luck with your decision!

DA

I've owned an MS-200 since they were introduced. Quite frankly I've been disappointed. The standard features are a great idea, Alpha Tags, CTCSS and DPL but the Relm Engineers fell short by making the radio double conversion. This radio is the worst I've ever owned when it comes to intermod and noise rejection. Now I've been told that Relm has a fix for the problem, but people that I've talked with here on the News Group and several e-mail reflectors report that the fix was a waist of money and recommended the use of notch filters. I did invest in and this did correct about 85% of my problem but still I should never have needed to make that investment. If I were going to do it again I would go with a Uniden 760 w/CTCSS even though it's only 100 channels it's a much better performer in my opinion. Good Luck -Dan- KE3UC

>

Well, I have to challenge the above a bit.

First off, while Digitalization is not radio, the medium for sending that digitized information IS radio. Monitoring is still possible, the trick is making the conversion back to analog with the information that you have.

It will NOT move from radio to non-radio methods. Even with S-C-A or some of it's so called competition such as Cerulean Mobile Computer solutions, radio is still the method of moving the data.

Insofar as aa "ten minute change at some computer console down at city central" , no it depends on the system. A system that is digitized, but not encrypted, cannot be changed so easily. It will take individual reprogramming of every unit on that system. OTAR or Over The Air Reprogramming will work on the encryption, but not on the basic digital.

Will there be radios commonly available to the hobbyist that will decode digital radio? I simply don't know. I never thought Motorola would sit still for trunktrackers, but I was wrong.

Dion,
I'm not sure where you get your imagination from.

No cucumbers at this end.

I didn't post any binaries.

Don't recall any clauses such as what you referred to with my ISP. Bet you couldn't prove that generalisation. The fact my ISP carried the binaries in this newsgroup probably means they don't care.

All I've learnt is that you have mistaken my identity.

I'm glad your offline reader didn't choke on my text only post.

But I nearly gagged on your loose attempt to educate me.

Cheers,
RB

5254. Annoying squelch tail on Uniden-made scanners

Newsgroup: rec.radio.scanner
Date: 1999-03-29 00:00:00 UTC
From: inpursuit@thespeedlimit.not
Message-ID: <37018413.2929660@news.pacbell.net>
Source record: 123762
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I noticed that every Uniden-made scanner in my collection (other than my Pro-46 and Pro-2026) has a noticeable squelch tail, whereas the GRE-made scanners I have don't have a squelch tail. There is a combination beep disable/squelch tail mod for the Pro-51, and it worked great on mine, but I haven't seen any other mods for getting rid of the squelch tail on Unidens. The last two scanners I bought have the longest squelch tails I have ever heard (with the exception of an unmodified Pro-51). These are the Pro-2046 and Pro-2056. I know that there is a common mod to disable keypress beeps on most scanners, and I have done that mod to numerous GRE and Uniden-made scanners. Is there a simple way to find out which resistor controls how long the squelch remains open after a carrier drops? The Pro-51 mod involved removing a resistor from the logic board (beep disable) and connecting this resistor in parallel with the resistor on the RF board that controls how long the squelch remains open after a carrier drops. Why can't Uniden spend a few CENTS more and remove the squelch tail from their scanners?

Spamblock in effect. Reply in newsgroups.

I Agree.

This is my pet peeve and enough so not to buy any more unidens. The BC9000XLT would have been a perfect radio and a keeper but the tail alone made me sell it. I also dot get why they can deal with this. I assume there are some technological trade-offs that have to do with this , but dont know what they are.

5257. Re: Which Outside antenna works best for all bands on scanner

Newsgroup: rec.radio.scanner
Date: 1999-03-29 00:00:00 UTC
From: dcisive@earthlink.net
Message-ID: <MPG.11694134ac7926379896ee@news.earthlink.net>
Source record: 123765

After having owned every antenna mentioned on this newsgroup, I would, with out hesitation give the top award to the Monitenna by Channel Master. It is a vertical dipole and although many would argue that there is better, after having tried them all, it was the clear winner. I found the so called gaps in stated reception spec by the manufacturer to have no effect on it's ability to function at the top of it's game from HF all the way up to 1000mhz. It is an amazing deal with 50ft of RG6 cable included for 50 bucks.

5261. harris county trunk list updates

Newsgroup: rec.radio.scanner
Date: 1999-03-29 00:00:00 UTC
From: Myles Barkman <kg5ai@tca.net>
Message-ID: <36FFA019.4A4F9F1C@tca.net>
Source record: 123769

I've updated my list of Harris County Trunk talk groups and have added info on the 2A28 system. This appears to be a type IIi system. Haven't had much time to figure out size codes but block 6 seems to be the only type I part. Several of the groups not heard on the 2318 system seem to be on the 2A28 system. Appears to be some overlap as well since I've heard 6544 and 8560 on both systems. They are probably not simulcast though (I only have one trunktracker). If anyone else has more info on the 2A28 system, please share.

Icom Users,

Regarding the Icom R2...
How do you handle the ability of this scanner to only be able to scan one band or all bands? Isn't this amazingly limiting? I'm getting a scanner as a handheld and as a mobile scanner, is it possible to operate the R2 without crashing your vehicle? ;)

And is programming this thing tough without a keypad? How about regular tasks, are they harder without the keypad? Is there programming software available for it yet?

Thanks for all input,

John Lochey

As far as I am aware, there are currently no programs or sites available (freeware, shareware, or other) that decode RD /LAP. And with the Big M's crack down on FLEX software and the like, I doubt we will see a program that will decode RD/LAP anytime soon, but of course, that is my opinion, and I may be wrong.

I just received last week a brand new Commtel 205 (European version of the Pro2006). Because of my deteriorating vision, I find it very difficult to read the blue lit display - so much so I am selling it. When I ordered it I did not think of the display as being an issue - and it is not for those of you with normal vision. This is a 220V desk or mobile radio. It has a plug for 12vdc operation which is how I run it. Some technical types just order the USA transformer from RS and installing it themselves. Boxes, paperwork, etc.. all new. Not a scratch. Basically, this unit does 26 MHz on up. Full 800. First $375 plus however you want it shipped. Money order only. You can find me on QRZ.COM by inserting my amateur callsign, WA1RD.

I spoke with "beepman" about this, but he asked that I not repost his comments here. I think most of us are smart enough to figure out what happened, anyway.

The bottom line is, there are many hobbyists that frequent this group that also happen to be employed by Motorola and their customers. So it came as no surprise to me when this happened. It was just a matter of time, and it reinforces for me how important it is to keep things like winflex to yourself. As well written as the program was, the mere act of decoding pager signals from commercial sources is (I believe) illegal. No doubt several paging companies got into a big snit over it, and this prompted legal action. The fact that law enforcement agencies, government officials, news media and the like use pagers to transmit "sensitive" data, also has alot to do with it.

I have noticed that programs that decode MDT data are being left alone, SO FAR.... This is probably because the MDT data transmitted by your local PD is public record anyway, and the data can easily be (and is some cases is already) encrypted. Not so with pagers. To encrypt that data would mean retrofitting/replacing countless millions of them at an astronomical cost. Much easier to just "plug the leak" by going after the author of the offending program.

With the RD/LAP project, I'm not sure how they will take it. In it's favor, it will only decode unencrypted RD/LAP transmissions and is intended for public safety systems only. But, RD/LAP is not an "open" protocol, and requires special licensing for its' use, as does the FLEX/REFLEX protocols.

I have a contact at Motorola that I can safely ask whether or not this will be an issue. I'll post details when I can.

Standard C558a Dual Band HT.

5W at 12 VDC
40+ memories (opt. 200+ memories with plug-in chip)
100-200, 300-500 & 800-900 MHz receive (including AM aircraft band)
TX Amateur bands
CTCSS Encode/Decode included
DTMF squelch with Paging
Ten auto-dial memories with TX delay
Scan busy, pause or hold
Call channel both bands
Dual frequency watch
Battery save
Cross-band repeat operation
Scan busy, pause or hold
Scan priority memory channels
DTMF Air Cloning
Two volume & squelch knobs for better control
3-way frequency selection, direct, rotary-up/down, arrow
23 Menu display
Operates from 6.0 to 16 VDC
Dimensions: 6.33" (H) x 2.17" (W) x 1.22" (D)
Weight with battery 12.52 oz

Has a Rapid Charger, and the supplied antenna, battery, and belt clip.
Manual included, but no box.
Also has extended memory module. (100 channels per band.) In Very Good Condition.

$250 obo.
Nate

25 to 999.975 MHZ
NO GAPS!
AM/FMN/FMW
200 Channels 10 banks of 20
10 search ranges
Scan speed: 35Ch/SEC

2 antenna inputs 1-BNC 1-TYPE N
User selectable steps 5, 10,12,5, 20,25,50,100 kHZ

Triple Conversion Receive
13.5VDC

Dimensions: 7WX2HX6D

Comes with infared remote control that can control all funtions of the radio
and the original user manual.

Looks great, works great

Multi Color LED display shows FREQ, MODE, STEP,Scan Resume mode, DELAY, ANT
Signal strenth meter, Channel, and much more.

Looks like an AM/FM car stereo

I made a post about this before but it wasn't very clear.

Say I have a scanner and set it to scan the whole cellular band from
bottom to top. I hear four or five frequencies active.
Now, if I had a list of the cells by frequencies I could go to it and
find the frequencies I heard and then I would be able to program in all
the frequencies on that cell. Then I could scan only the frequencies of
that cell and not the whole band.
I used to have a list like that but have lost it. Anyone know where
I can get one?

Why didn't you simply post the freqs instead of spewing your web url all over usenet? Share the magic when you get a chance and spare us the bs. It would save everyone lots of time.

If they are Nicads, you just did the best thing possible. All nicads need to be run completely down once and a while to keep them from developing a "memory." After giving my radios a good workout, I will leave them on and completely run them down, then put a fresh charge on them. My batteries last for years.
I was allerted to this when I bought a new video camera. There is a "refresh" setting on the charger. After several uses I am supposed to push this setting and the charger drains the batteries and then fills them back up again with a fresh charge.
Put the scanner on charge, chances are you didn't hurt a thing.

Heres the problem ,just got my 3000 the other day, and i have
the FM channels and the TV channels but i cant get the local AM channels
i mean its a "no gap" radio with AM,FM.WFM which i dont know how to work
either by the way .
So if anyone knows how to work the 3000 and has the time to walk
me threw this AM thing that would be very kind ,there just isn`t that
much about it in the booklet
thanks in advance

With all due respect, I had an opportunity to play with a AR-16 next to my R2 earlier this month and my conclusion is " THERE IS ABSOLUTELY NO COMPARISON WHATSOEVER". The R2 blows the 16 away in all aspects, especially sensitivity and audio quality. The R2 is built to military spec and the AR-16 feels like a toy.

Uniden Bearcat BC 100xlt Handheld Scanner

Features: -New NiCd Battery Pack
-(1) VHF Rubberduck Antenna
-(1) UHF Rubberduck Antenna
-Earphone (extra length)
-Wall Charger
-Original Case

Radio Features -100 Channels
-10 Ch./bank, 10 banks
-Weather Search
-29-54, 118-174, 406-512 Mhz
-Band Search

The radio has had some use and I'm proud to say, I've taken good care of it over the years. Everything works perfectly.

I'm asking $90.00 for this beauty. It is a very useful radio and can also give you years of quality scanning.

Please EMAIL me or CALL me at (305)895-4355 between the hours of 10:00am & 9:00pm.

73,
Bill

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET groups
rec.radio.scanner, alt.radio.scanner, and rec.radio.info.
It is also available electronically from the
rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article discusses the purchase of used scanner radios
and includes these topics:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other

radio hobbyists.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Radio Shack repairs scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series (see US patent 4,011,515, granted 3/8/77). Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Tennelec MCP-1 (see US patent 3,961,261, granted 6/1/76), Bearcat BC-101 (see US patent 4,179,662, granted 8/4/78), and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. See US patent 4,057,760, granted 11/8/77. The GRE-manufactured SBE Optiscan (and its Sears clone) required poking or covering a series of holes in

plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to

cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

Electra Corporation stocks crystals for the Bearcat scanners:

Electra Corporation
11915 E. Washington St.
Cumberland, IN 46229
Phone 317-894-3229

Crystals for Bearcat and other models are available from:

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner. The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.]

I am often asked, "How do you find these frequencies?"
This article answers the question in various sections:

Books
Magazines
Government Records
Web Sites
Federal Radio Stations
Radio Clubs
Do Your Own Sleuthing
What Makes Station Identification Difficult?
Examine the FCC License on Premise
Examine the Labels on Radio Equipment
Examine the Antenna to Determine Frequency Band
Equipment to Determine Frequency Usage
How Can I Determine To Whom I'm Listening? - An Example
Summary
Addresses

Books

The most convenient source of fire and police frequencies is the Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and

larger book stores for under $13. Police Call Plus is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. A few pages of local airport and nonsensitive federal government frequencies are included. Selected business frequencies are listed, too, but without callsigns and other details.

I highly recommend Richard Barnett's book, Monitor America, published by Scanner Master Corp. A 3rd edition is available from Grove Enterprises for about $30. It is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the Radio Communications Monitoring Association (RCMA), now defunt. Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call Plus, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The longstanding source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It

is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and the sensationalistic Popular Communications magazines.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $49 instead.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

The PerCon Spectrum CDROM sells for under $30 and contains a handful of fields for every FCC license in the US. However, Public Safety license information contained in the Winter 1996 Spectrum doesn't appear as up to date as in the 1997 Police Call Plus.

Spectrum works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at

http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample. |

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Web Sites

If you have access to the World Wide Web, you can visit dozens of sites with local frequency lists. You can look up civilian aero frequencies for specific airports at: http://www.airnav.com/airports/.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. (See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available on the WWW page http://aosc.rpmdp.com and from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio,

or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at

the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was

permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Examine the Antenna to Determine Frequency Band

You can often determine a transmitter's frequency band by the size and type of antenna used.

The Police Call Plus book contains sketches of antennas. Antenna catalogs are crammed full with antenna pictures and specifications and they are usually free. Contact Antenna Specialists (216-349-8400), Cushcraft (603-627-7877), Tessco (800-472-7373), Maxrad, Larsen Electronics (800-426-1656), and other companies in the land mobile equipment business.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and

store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi

antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 1999 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

One way to roughly estimate a radio's age is to examine the
4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most

recent date stamp.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation sells crystals, antennas, power cords, owner's manuals ($11 ea) for some older (pre-Uniden) Bearcat scanners. Electra Corporation is located at 11915 E. Washington St., Cumberland, IN 46229. Phone 317-894-3229.

I cannot furnish schematics, manuals or parts. To order a user manual for an Electra/Bearcat scanner from Uniden, call (800)235-3874 extension 2553. You can also download an electronic copy of the user manual for recent Bearcat models from the Uniden web site:

http://www.uniden.com/docs/service/support.htm

Some schematic diagrams may be obtained from Uniden's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges.

The phone number for repair is (800)297-1023, too. I recommend you call repair before sending the broken scanner. Items for repair via UPS (include receipt if still under warranty) are usually sent to:

Uniden America Corp.
4700 Amon Carter Blvd.
P.O. Box 95002
Fort Worth, TX 76155

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and

2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Matt Roberds fixed a BC220 which experienced memory loss if power was removed by resoldering the positive wire to 2-AA battery holder.

As built, the BC220 logic board is grounded only through its mounting screws. In the BC220, Matt recommends adding real wire ground jumpers from the main board to the feature (logic) board to fix grounding problems.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. See March 1996 Monitoring Times magazine for BC800XLT capacitor locations and repair information.

The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

Jim Craig replaced a 22uF/35V C98 capacitor to repair his BC210XW.

Paul Grohe replaced a failed C98 with a low ESR (equivalent series resistance), high frequency, switching regulator grade capacitor, e.g. a Panasonic HF series capacitor. He also recommends adding a 0.1 ceramic capacitor in parallel with C98.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Failure of IC9, the 9 volt NJM78M09A regulator in a BC800XLT is another cause of a blank display.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of

a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Matt Roberds repaired the Montgomery Wards version of a BC220 and contributed these insights:

"I did add some heat-sinks, but you have to be careful what you do with the TIP29 on the logic board. I added a long, flat heatsink to it and immediately created a whine in the audio. I didn't use an insulator, as this was a temporary first-try. As far as I can tell, the heatsink was radiating noise from the logic board into the front end on the radio board, which ended up being just below the heatsink. Bypassing the TIP29 (a voltage regulator) with disc ceramics didn't work; using a smaller heatsink and an insulator fixed the problem."

"There is also a 220 ohm 1/4 watt resistor on the logic board. It feeds the TIP29 from the main +16v supply. It looked a little crispy. I pulled one end and measured the current through it and it was about 30-35 mA. This works out to right at 0.2-0.25 watt dissipation. I didn't have a higher-wattage resistor, so I substituted 2 470-ohm resistors in parallel."

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there is no audio and the green backlight no longer functions, a tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201 (2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC to several stages of the BC200XLT. Its main purpose is to

switch off power hungry stages of the BC200XLT when the CPU thinks the NiCd voltage has fallen below a threshhold. That's an attempt to limit the current drain on weak NiCds to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board, adjacent to the black multi-pin connector which mates the Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily, by something in the scanner drawing too much current through it. In one case, capacitor C36 shorted. It's a 220 uF 10v electrolytic, located on the component side of the main board, connected from pin 8 of the audio IC (IC2 NJM386SL) to ground. Capacitor C55 shorted in another BC200XLT. Gary Bean reports he substituted a 2SA1298 for Q201 and it worked fine. In a pinch you bypass Q201 by soldering a short piece of bare wire between the collector and emitter, but you must first fix the component which caused Q201 to fail.

BC9000XLT: Loss of Sensitivity

John Ward has fixed two BC9000XLTs which suffered from "low sensitivity." He fixed the solder joint where the antenna jack connects to the circuit board. In both cases the tab from the board was on the opposite side of the jack from where the little blob of solder applied at the factory was located.

It was an intermittent problem that depended upon the position of the antenna cable - if the weight of the cable placed tension on the jack in one direction contact was made and the radio worked fine. If the cable placed tension on the jack in the opposite direction contact was lost and so was reception. The gap was barely noticeable.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier activated relay inside the BC890XLT wore out. Andy found the identical relay sold at Radio Shack (part #275-232) and says the BC9000XLT uses the same relay, too.

Replacement Bulbs for BC760XLT

The Uniden BC760XLT's SCAN, MAN, PRI, and HOLD buttons are illuminated by "grain of wheat" type incandescent bulbs. Gary Saffer reports that the bulbs and buttons are located on a small printed circuit board which sits behind the radio's face plate. Gary unsoldered the burned out bulbs in his radio and replaced them with 12 volt Radio Shack bulbs (#272-1092c). They should last a long time when powered by the 8 VDC supplied by the BC760XLT.

Open Resistor in BC140

Robert Casey fixed his deaf, 16 channel Bearcat BC140 scanner. A 10 ohm resistor had opened that fed a circuit that generates 22V for the varactor diode tuner circuits. Without the 22V, there was no tuning of the local oscillator and front end, and no reception. What he did was compare voltages to a second working BC140.

Sources for Replacement NiCd Battery Packs

Replacement NiCd battery packs and inserts for the BC100XLT, BC200XLT, BC2500XLT, BC3000XLT, and other scanners are available from Uniden. I've purchased them at lower cost from:

1. Mr. NiCd - E. H. Yost and Company, 2211-D Parview Rd., Middleton, WI 53562. tel. (608)831-3443. email ehyost@midplains.net

2. Battery-Tech Central, 2818 Southland Street SW, Cedar Rapids, IA 52404-4141. tel. (800)267-3087 or (319)364-0855. email rlassoc@inav.net

Batteries Plus has stores across they country and some have rebuilt Uniden NiCd packs for under $20.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA.
High level overviews of the following topics are presented:

Why Scanning?
Is Scanning Legal?
What Scanner Should I Buy?
What is a CTCSS and DCS Tone Squelch Feature?
How Do I Determine the Proper CTCSS or DCS Code?
Scanner Antennas
Coaxial Cable Feedlines
Where Can I Buy A Scanner?
Modifying Your Scanner
Scanner Repair Shops
Where Can I Obtain Frequency Information?
Do Your Own Frequency Detective Work
How Can I Use Equipment to Uncover New Frequencies?
Scanner Clubs and Mailing Lists

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,

taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies.

It is illegal for companies to sell or import into the USA recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

The rules define "readily altered by the user" as "clipping the leads of, or installing, a simple component such as a diode, resistor and/or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip

using special access codes or an external device, such as a personal computer."

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations and the AR5000 works well.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. Beware of low cost programmables which can't search. Some of the newer models, like the Uniden SportCat and Radio Shack PRO-2046, allow searching between limits, but the limits are factory programmed and cannot be altered.

Get a model which covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 50 channel scanner will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate. The $2000 Icom R8500 and AOR AR5000 models are exceptions.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, BC230XLT, and Radio Shack PRO-43 and PRO-60 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites.

Looking for value? At $180 discount price, the 100 channel Uniden/Bearcat BC860XLT base is a good value and available at most Wal-Mart stores. The RELM HS200 portable performs very well is an excellent value at its $250 street price.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 was replaced by the 1000 channel PRO-2035, which was replaced by the PRO-2042. The portable Radio Shack PRO-64 and PRO-60 are good performers. All five models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

CTCSS and DCS Tone Squelch Feature

Upscale scanners can be optioned with a subaudible tone decoding squelch circuit. There are two types: CTCSS (Continuous Tone Coded Squelch System) and DCS (Digital Coded Squelch). In simple terms, this feature lets your scanner ignore signals you don't want to hear.

Most land mobile two way radios, except trunked systems, transmit either CTCSS or DCS signals subaudibly along with the voice information. U.S. military field radios employ wider deviation and a 150 Hz CTCSS tone, not supported by most scanners or CTCSS decoders.

There are over 40 different CTCSS codes and you can program a specific CTCSS or DCS code into each memory channel. Using a CTCSS or DCS decoder permits your scanner to open the squelch only if the transmission has a code which matches the code you program.

CTCSS and DCS decoding offers several advantages:

1. Ignore unwanted signals on shared frequencies: It is common for several users to share the same frequency, e.g., my county sheriff uses the same frequency as Chicago Police, located about 60 miles away. I want to hear my sheriff's transmissions but don't want the scanner to stop on or listen to Chicago Police transmissions. This is especially a problem when radio propagation is good, e.g., during a "band opening," when reception range is temporarily increased.

2. Combat intermodulation interference: Helps keep out intermod and image interference from strong pagers and other signals which are not transmitted with a matching code.

3. Ignore scrambled transmissions: Many federal law enforcement agencies (FBI, Secret Service, etc) and some local police agencies employ digital voice scrambling, which sounds like white noise and is annoying to hear. The CTCSS or DCS code is sent only when the station is transmitting unscrambled, or "in the clear." You can program federal frequencies along with the proper code into your decoder-equipped scanner so you won't have to listen to the scrambled mess and only hear their transmissions when they are unscrambled.

CTCSS also goes by various tradenames: Motorola's PL (Private Line), GE's Channel Guard, and RCA's Quiet Channel. Motorola uses the tradename DPL (Digital Private Line) for its digital coded squelch.

How Do I Determine the Proper CTCSS or DCS Code?

There are a few ways to determine the CTCSS or DCS code transmitted by a station:

1. Use an outboard CTCSS/DCS reader which must be attached to the discriminator output circuitry inside the scanner. The reader has an LCD or LED display which indicates the code when a station transmits. I use a CSI model CD-1 Communications Decoder Unit, an an excellent reader which sells new for about $200. (Connect Systems Inc., Ventura, CA, 800-545-1349, www.connectsystems.com).
2. Many of the ScannerMaster guides, as well as scanner club newsletters, print the CTCSS codes used by transmitting stations.
3. On some scanners equipped with the CTCSS squelch, you can program into memory the frequency of interest. Then you "tune" slowly through all the different CTCSS and/or DCS codes until the squelch opens and you hear the dispatcher talking. This is a slow process and the station has to keep transmitting during it.
4. A slow, brute force method is to program the same frequency but a different CTCSS code into several channels and see where your scanner stops.
5. In some cases, I've actually examined the walkie-talkies I want to monitor and found the CTCSS code printed on a label on or inside the radio.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer these alternative antennas for use with portable scanners:

1. The Icom FA-1433B dual band flex antenna, a thin and very flexible rubber antenna, is slightly longer than a stock heliflex but provides better performance.
2. The Austin Condor is a 12" long rubberized antenna available for about $30. While considerably longer than the stock antenna and the FA-1443B, the Condor is very flexible and provides VHF-high band reception superior to both. It is not designed to cover the VHF-low band, but will allow reception there at least as good as shorter antennas. The Austin Condor is available from Grove Enterprises.
3. The "Thin-Stick" is an 18 inch telescoping antenna for

extended range. It is made in USA by Smiley Antenna Co., Inc. and is designed to cover both the 2 meter and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A (available from Amateur Electronic Supply) or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 50 miles or more, depending on terrain. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U, e.g., Belden type 8267, has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Be sure it is on sale, as Radio Shack list prices are high and their scanners are offered at reduced prices by mail order discounters.

Discount chain stores like Wal-Mart, Best Buy, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902. For a free catalog, call (828)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove-ent.com

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is http://www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411. Web page is http://www.aesham.com

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/hamradio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then

copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

For information on "virtual downconverter" modifications, see Steve Donnell's article in January 1995 RCMA Scanner Journal or February 1996 Monitoring Times. Reprints of articles from Monitoring Times are available for $3.00 each plus a self-addressed stamped envelope from:

Grove Enterprises,
7540 Highway 64 West,
Brasstown,
NC 28902. For a free catalog, call (828)837-9200.
Telephone (orders only): (800)438-8155.

I don't get any part of this reprint fee.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - (www.iinc.com/ggcomm or email ggcomm@iinc.com or ggcomm@aol.com) This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 7825 Black Street Rd., LeRoy, NY 14482.

Repair tips for Bearcat and Radio Shack scanners are discussed in two other FAQ articles.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Plus, published each year in 9 regional volumes by Hollins

Radio Data, and sold at Radio Shack and larger book stores. The newest editions contain abbreviated business listings, too, although callsigns and other details are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 828-837-9200, www.grove.net) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning (NatScan) is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. Early issues disappointed experienced scanner hobbyists, but it now has a good column on scanner modifications and has greatly improved its coverage of east coast frequencies since merging with NESN (North East Scanner News). The best scanner frequency

lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM for $100. In the 1995 edition, fields are different than PerCon's Spectrum CDROM but the data appears to be of the same vintage. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample. |

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the

scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Peter Laws administers an electronic mail list read by over 700 hobbyists devoted to scanners and scanning. It's called "scan-l" and for more information, read:

http://www.wildstar.net/~plaws/scan/scan-l.txt

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. You can obtain an electronic subscription to the CARMA Newsletter. For more info, see:

http://www.TheRamp.net/shabec/carma.htm

The club's mailing address is:

CARMA
P.O. Box 2681
Glenview, IL 60025

All 1999 meetings (except August) will be held on Saturdays at Phillies Pizza, 6300S. Kingery Highway, located in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook, IL,

The 1999 meeting schedule is: April 3, June 5 (picnic at Argonne National Labs), August 7, October 2, and December 4.

The CARMA Picnic will be June 5th, 1999 at the Argonne National Labs Picnic Pavilion, Cass Avenue, south of I-55 in or around Darien or Lemont. The picnic will start whenever someone arrives. The regular meeting will be in the Pavilion at 1:00 PM. If the weather is totally frightful we also have a room inside the Laboratory building available for us.

The Picnic is BYOE (Bring your own everything) If you want to eat or drink, bring it with you, as well as your BBQ or six pack.

REPAIR TIPS: RADIO SHACK SCANNER RADIOS

Copyright 1997 - 1999 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

Radio Shack has been selling scanners and monitor receivers
under the Realistic and Radio Shack labels for over 30
years. Most of them were manufactured by General Research
Electronics of Tokyo, though many newer models are
manufactured by Uniden.

The date of manufacture is usually printed on a gummed
label on the scanner as well as the cardboard box. A code
of 12A5, means the scanner was made in the 12th month of
1975, 1985, or 1995, for example.

There's another way to date Radio Shack scanners
manufactured by Uniden. The first digit of the long serial
number is usually the last digit of the year of
manufacture.

Another way to roughly estimate a radio's age is to examine
the 4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most
recent date stamp.

Schematics, Owner's Manuals, and Parts Available

I cannot furnish schematics, manuals or parts. Service manuals for most Radio Shack scanners sold through mid-1997 may be ordered through your local Radio Shack store.

If Radio Shack doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

Parts lists for recent and many older models are available on line at: http://support.tandy.com. Parts may be ordered through Tandy National Parts, telephone (800)442-2425 or (817)870-5600, or through your local Radio Shack store

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

GRE-Built Base Models: Dim Backlight

The backlight in many base models, including the PRO-2022, PRO-2004, and PRO-2005/6 is implemented by an electroluminescent panel, which grows dim with use.

The EL panel used in the PRO-2005 and PRO-2006 is designated EL-501, and is identified by Radio Shack part #10800050. A new EL panel can be ordered through your Tandy National parts (see above) or local Radio Shack store and sent to your home. Radio Shack no longer sells replacement EL panels for the PRO-2004.

Replacing the backlight is an operation which requires care and patience. Purchase a service manual, and study the exploded parts diagrams as you read the following steps.

Top and bottom cabinet pieces must be removed, then the speaker unplugged from the main board. The front panel assembly must be removed from the chassis by removing 4 flat head screws, 2 on each side. You need not disconnect all the wiring harnesses, though you might have to unplug one so it won't get in the way of a hot soldering iron.

Unsolder the bare ground wire soldered to a large shield on the back of the front panel, located near the back of the squelch control. Two ground braids must be temporarily disconnected by removing the screws which fasten them to the chassis. After removing the volume and squelch knobs, you must remove 8 small screws which fasten the plastic front panel to the diplay board.

The old EL panel is fastened by a bead of glue and two foil type leads soldered to the display board. It's easier to cut the two leads from the old EL panel before unsoldering. A sharp knife should be used cut away the glue. The old EL panel can then be slid gently out from behind the LCD display.

The new EL panel can be installed by reversing the process, though I found that it is not necessary to glue the new panel. The two foil leads must be soldered using a minimum of heat. Reassemble the pieces in reverse order of disassembly.

GRE-Built Portables: Worn Out Keypads

The keypad on late model GRE-made Radio Shack portables, e.g., PRO-39 and PRO-43, can become unreliable after prolonged use. The best repair is to replace the rubber keypad instead of trying to restore contacts using chemicals. A replacement rubber keypad may be ordered inexpensively through Tandy National Parts or your local Radio Shack Store.

PRO-43: Loss of Audio

Early PRO-43s were built with a 200 mW speaker (mfr's part #EAS-3P123A). The voice coils in some of these speakers have opened, resulting in lack of audio output, though audio is still available from the earphone jack. A more capable 500 mW speaker is available through Tandy as replacement (EAS-3P127).

PRO-43: Freezup

If you attempt to lock out all 20 channels in a memory bank, then scan only that bank, your PRO-43 will freeze up and be placed into a catatonic state. Use the procedure documented in the PRO-43 user manual to fully reset the scanner. This will "break the trance," but all the memory channels will be cleared.

PRO-2004: Dead

If your PRO-2004 is completely dead, check R235, a 1 ohm, 1 watt resistor mounted vertically on the main board.

PRO-7A: Channels 1 - 4 or 5 - 8 Dead

If the first or last 4 channels in your 8 channel PRO-7A crystal scanner are not working and the lamps for those channels won't light, replace IC4 or IC5 (type 7400A).

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1999 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

4. If space permits, you can replace the stock resistor with a higher value variable resistor ("trimpot") and adjust to suit.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver Model No.	Res-istor Value	Stock Comments
Radio Shack PRO-24	R35	33K replace with 220K. Located between pins 12 and 14

	of MC3357 (IC1)
Radio Shack PRO-2002	R197 47K try 220K.
Radio Shack PRO-2004	R148 47K remove R148
	or replace with 220K.
	On linear board,
	between pins 12 & 14
	of TK10420 (IC2)
Radio Shack PRO-2006	R152 33K try 100K or higher.
Radio Shack PRO-2022	R91 33K replace 33K
	with 220K.
	Between pins 12 & 14
	on IC-1 MC3361
Radio Shack PRO-2035	100K replace 100K
	with 220K.
	Between pins 12 & 14
	of TK10420 (IC-2)
Electra/Bearcat 220	R75 2.7M may be ok as is
Electra/Bearcat 20/20	R75 2.7M may be ok as is
Electra/Bearcat 250	R66 2.2M may be ok as is
Uniden/Bearcat 760XLT	R58 22K replace with 6.8K
	or other value.
	(select value for
	the particular radio.)
	Located on pin 14
	of MC3359P IC
Uniden/Bearcat 800XLT	R91 860K replace with 2.2M.
	Located on pin 14
	of MC3359P IC
Plectron P1	R81 180K may be ok as is
Plectron 700	R96 180K replace with 560K

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

In the 1960s and 1970s, thousands of firemen and ambulance
squad members came to rely on their crystal controlled,
transistor Plectron and Motorola desktop monitor receivers.
They have now been replaced by battery operated portable
pagers, and the desktop models are often available at
hamfests in the $5 - $25 range. Since many are in rough
condition and need repair, a hamfest special is better
suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are
excellent for dedicated monitoring of local frequencies --
a task for which you wouldn't want to tie up your 400
channel programmable scanner. They are desktop models
which can be powered from 117VAC or 12VDC with the proper
mobile cord. The audio quality of a Plectron P1, Plectron
700 series, and Motorola Alert Monitor is far better than
any consumer grade scanner and the sensitivity, image
rejection, and intermod immunity is outstanding when
aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band
receivers: VHF-low, VHF-high, or UHF. No single Plectron
or Motorola Alert monitor can cover the entire 30-50 MHz

band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal

scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

The tape recorder inside the Receiver/Recorder employs two rubber belts. The Projector Recorder Belt Company makes replacement belts which work fine, though they may not be the original equipment:

1. PRB SCA8.6 (218 mm)
2. PRB SCQ 2.5 (64 mm)

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Crystals

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal fundamental frequency. Merely supply International with the exact receiver model number, printed on the rear label, and the frequency you want to monitor. They will perform the necessary calculations.

Crystals for Plectrons

The Plectron P1 series contain two crystals. The second local oscillator crystal is 11.155 MHz regardless of band. On VHF high band (148 - 175 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz)
= (station freq (MHz) + 10.7) / 4

or

Crystal frequency (MHz)
= (station freq (MHz) - 10.7) / 4

On VHF low band (25 - 54 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz) = (station freq (MHz) + 10.7)

or

Crystal frequency (MHz) = (station freq (MHz) - 10.7)

There are two crystals (Y1, Y2) used in the Plectron R700 series, one for each local oscillator. The crystal formulas are:

RF Range (MHz) Y1 (MHz) Y2 (MHz)
_____
25-29 (f+10.7)/3 11.155
29-32.6 (f+10.7)/3 11.155
32.5-35 (f-10.7)/2 10.245
35-41 (f-10.7)/2 11.155
41-47 (f-10.7)/2 11.155 (use 10.245 MHz
for Y2 on 44.62 MHz)
47-54 (f-10.7)/3 11.155
148-158 (f-10.7)/9 11.155
158-175 (f-10.7)/9 10.245
450-470 (f-10.7)/18 11.155

The economy Plectron 500 series use this scheme for the first local oscillator crystal:

RF Range (MHz) Crystal (MHz)

---

25 - 35 (f+10.7)
35 - 54 (f-10.7)
148 - 174 (f-10.7)/4

Most Plectron 500s use an 11.155 MHz second local oscillator crystal. However, a 10.245 MHz crystal is used instead for receivers in these ranges: 33.4 - 33.78, 44.62, and 158.78 - 158.82 MHz.

Power Cords

AC power cords for both types of receivers use unique connectors and are scarce. I published the pinout for both Plectron and Motorola Alert Monitor receivers in June 1998 Monitoring Times magazine.

You can buy the proper replacement power cords but it's much cheaper to drill a hole on the rear panel and solder on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

Squelch and Minimum Volume Setting

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely

silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760
email: weber@citizen.infi.net

You can also obtain Plectron repairs and parts from:

Northeast Communications
4 Oak Ridge Rd
Newfoundland NJ 07435
201-697-8804

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model UHF VHF-high VHF-low

SM-301 X X X
SM-302 X X

SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from
the crystals used in the conventional single channel
Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

Plectron Alternatives

Too bad Plectron is out of business. If you wish to
purchase a new receiver with "Plectron-like" signaling
capabilities, contact Reach Electronics:

Reach Electronics
1311 West Pacific
Lexington, NE 68850
(308) 324-6661
(800) 445-0007
FAX: (308) 324-4985

Reach sells tone & voice pagers, Alert monitors, and
ENCODERS. They also do contract manufacturing.

I currently have no Plectrons or Motorola Alert Monitors
for sale. I'm hoarding them. :-)

HAMFEST/COMPUTERFEST CALENDAR 1999 - NORTHERN ILLINOIS
last updated March 13, 1999

o Please report additions or changes to Bob Parnass, AJ9S, office phone: (630)979-5414, electronic mail: parnass@bell-labs.com. Thanks to Dennis Dale, Rick D. Wilson, Tom Harker, and ARRL for providing some of the information.

APRIL 1999

April 11 (Sun): Middleton, WI. Madison Area Repeater Association. 8 AM - 1 PM Middleton Conference Center, 1313 John Q. Hammons Drive Middleton, WI 53562. The Middleton Conference Center is located in Middleton, WI, near the west side of Madison, WI. From the intersection of Interstate 90 and Highways 12 and 18 near Madison's South-East corner, take Highway 12 West. Stay on Highway 12 until you reach Greenway Blvd. Exit to Greenway Blvd. and turn left. Then turn left on John Q. Hammons Drive. The Conference Center is attached to the Marriot which is clearly visible from the intersection of Highway 12 and Greenway Blvd. Talk-in Frequency: 147.75/.15. Info: Paul Toussaint, N9VWH, MARA President, prt@execpc.com. The MARA telephone voice mail (608)245-8890 . http://skywarn.ssec.wisc.edu/mara/swapfest

Apr 17 (Sat), Wheaton, IL - Giant Computer show (see below). Dupage County Fairgrounds.

Apr 18 (Sun), Orland Park, IL Giant Computer Show & Sale (see below). orland Park Civic Center.

April 25 (Sun): Galva, IL. Area Amateur Radio Operators Hamfest. When: 8 am until 2pm, April 25, 1999. Where: The National Guard Armory Tickets: Advance tickets $5 double stubs, at the door $5 single stub, No advance sales after March 25th. Outside flea market space available. Electricity, available on a first come first serve basis. Bring your own extension cords. VE Testing will be available by appointment only. Talk in 145.4900 - 88.5 PL / 146.460 simplex. Breakfast and Lunch will be available and served by the National Guard Relief Members. For set up times, advance ticket sales or other information, contact: (1) Bill Anderson WB9TEW, 103 SE 2nd Ave. Galva, Illinois 61434-1854.

tel. 309-932-3023, bill@inw.net. (2) Tom Davis N9OSP, 802 Rose Street, Kewanee, Illinois 61443. Tdn9osp@cin.net

April ?? (Sun): Stickney, IL. Dupage Amateur Radio Club, Hawthorne Race Course. Hours 8 AM - 2 PM. Setup 6 AM.

MAY 1999

May 1 (Sat), Cedarburg, WI - Ozaukee Radio Club Swapfest, Info: Joe Holly, AA9HR, 1702 Holly Ln., Grafton, WI 53024, 414-377-2137

May 2 (Sun), Sandwich, IL - Kishwaukee Amateur Radio Club Hamfest, Sandwich Fairgrounds. Admission $?. Ends at 2 PM. Talk-in 146.73 MHz. Info: Bob Yurs W9ICU, phone 815-895-3219, email: w9icu@tbcnet.com. (Nice mid-sized hamfest out in country. Lots of tailgating. Few commercial exhibitors. Always a good time. Fairly good restroom facilities - AJ9S).

May 14, 15, 16 (Fri - Sun) - Dayton, OH. Dayton HamVention. See http://www.hamvention.org

JUNE 1999

Jun 6 (Sun), Princeton, IL - Starved Rock RC. info: Frank Carraro, KF9NZ, PO Box 198, Leonore, IL 61332/ 815-856-3773. http://www.qsl.net/w9mks/ E-mail: w9mks@qsl.net. (Usually an excellent hamfest. Unlimited space outdoor flea market, some indoor space, though few big name commercial vendors. Crude restroom facilities. - AJ9S)

Jun 13 (Sun), Wheaton, IL - Dupage County Fairgrounds. Six Meter Club of Chicago. info: Joseph Gutwein, WA9RIJ, 7109 Blackburn Ave., Downers Grove, IL 60516-3925. tel. 630-963-4922

JULY 1999

Jul 11 (Sun), Peotone, IL. Kankakee Area Radio Society. Will County fairgrounds. Admission $5 at the gate. Take I-57 to Peotone Exit 327 (east). 146.94 MHz (-600) talk-in. info: Don Kerouac, K9NR, 6311 East Flora St., Kankakee, IL 60901. tel. 815-939-7548, E-mail: k9nr@juno.com. http://www.geocities.com/capecanaveral/hangar/5711 For Reserved Tables and Advanced Tickets, send check (payable to KARS) and S.A.S.E. to: CHIP MOORE, K9IOC, 289 S. Euclid Ave. Bradley, IL 60915, E-Mail: chipm@megsinet.net or to BILL DESALVO, W9OQW, 403 Birch Dr., Shorewood, IL 60431. 815-744-5099.

Jul 18 (Sun), Sugar Grove, IL. Fox River Radio League. Waubonsee Community College. For tables, tickets, and information: contact N9UZC James E. Von Olnhausen, n9uzc@amsat.org, (630)-879-3042, FRRL, Box 673, Batavia, IL

60510-0673. http://www.frrl.org/hamfest.html (good, small to midsized hamfest. Easy parking. Modern restroom facilities. - AJ9S)

AUGUST 1999

Aug 7 (Sat) - Quincy, IL. Western Illinois Amateur Radio Club Ham Radio and Computer SWAPFEST 1999. 8:00AM to 2:00PM. The Eagles Alps Grounds (3737 North 5th Street) 4.5 miles north of downtown Quincy with easy access from US Highway 24. Admission $3.00 at the Gate ($2.50 in advance) per person, under 12 - Free. ARRL VEC testing for all license classes at 12:30PM. Indoor Flea Market space available for $5.00 which includes one 5' table. Outdoor tailgating space - Free. Talk-in on 147.63/147.03 MHz. Plenty of convenient parking available. Lunch will be served on the grounds. Children's playground area. For additional information contact N9JF, jfunk@adams.net

Aug 8 (Sun), Peotone, IL - Hamfesters Radio Club. Will County fairgrounds. info: Dave Brasel, NF9N, 6933 West 110th St., Worth, IL 60482. E-mail: nf9n@aol.com. tel. 708-448-0580 (Usually an excellent hamfest - AJ9S).

Aug 29 (Sun), Woodstock, IL. Tri-County Radio Group. McHenry County fairgrounds. Talk-in: 146.52 Simplex. info: Bob Grosse, N9KXG, PO Box 3107, Skokie, IL 60077-6107 E-mail: tcrg@hotmail.com, http://quality-enterprises.com/tcrg/. Tickets: Advance With Double Stub $4.00 - At Gate $5.00 Single Stub - $6.00 With Double Stub . Exhibit Building: 8:00 A.M. - 3:00 P.M. Table Rental: $14.00 For 8' Table. Flea Market: 6:00 A.M. - 3:00 P.M. No Additional Charge For Flea Market Space Info (708) 944-0500. Fax (847) 658-1678. (fairly good, small to mid sized hamfest - AJ9S).

SEPTEMBER 1999

Sept 25, 26 (Sat & Sun), Grayslake, IL Chicago FM Club. Lake County fairgrounds. info: Mike Brost, WA9FTS, 5127 North Monterey Ave., Norridge, IL 60656-3245. tel. 708-457-0966 (the biggest and best hamfest in northern IL - AJ9S)

COMPUTER SHOW NOTES

Computer Central computer shows are held at the College of DuPage, Main Arena of the Physical Education Building Park Blvd & College Road, Glen Ellyn, Il. 847-940-7547. $5 admission with card, normal admission $6.00. Opens 9:30 am - 3:00 pm. See http://www.computercentralshows.com web site.

Giant Computer shows are held by Micro Media, Inc. Shows are usually held at the Orland Park Civic Center, 147th St. & LaGrange Rd., Orland Park, IL or at the DuPage County Fairgrounds, County Farm & Manchester Rds., Wheaton, IL. Admission is $6. Show hours are 9:30 AM - 3 PM. To get on the mailing list or get more information, call (708)974-3123. See http://www.giantcomputershow.com

Computer Country Expo is Lake County's largest computer expo. The event is held on designated Saturdays from 9:30 AM to 3:00 PM. This show features computers, supplies, games, parts, software, accessories, CD-ROM, monitors, diskettes, printers, keyboards, modems, disk drives, cables, expansion boards, services, etc. Lake County Fairgrounds, Route 120 (Belvidere Rd.) & Route 45, in Main Exhibit Hall Building #1=9720,000 sq. feet. For a show map, exhibitor info, and discount coupon, visit the web site at http://www.ccxpo.com.

SCANNER RADIO REVIEW BRIEFS

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET groups
rec.radio.scanner, alt.radio.scanner, and rec.radio.info.
It is also available electronically from the
rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than
70 old and new scanner radios and monitor receivers.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. This article
describes a few of the FM receivers in my collection, and
other models I've tested. It is not meant to be complete.

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass,
Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass,
Monitoring Times, May 1995.

I have published full length reviews and modifications of
these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004

Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements
Dec 1995 - Radio Shack PRO-2040
Jan 1996 - Plectron & Motorola Alert Monitors
Feb 1996 - Radio Shack PRO-2042
Mar 1996 - Tips for Fixing Bearcat Scanners
May 1996 - Compendium of Scanner IFs
Apr 1996 - Uniden/Bearcat BC220XLT, BC230XLT Portable
Jun 1996 - modifications & tips for the Uniden/Bearcat BC9000XLT
Jul 1996 - Uniden/Bearcat BCT-10 mobile
Aug 1996 - BMI Nitelogger II tape recorder activator
Sep 1996 - PRO-2022 modifications
PRO-2042 baseband audio tap
Oct 1996 - Radio Shack PRO-2046 mobile
Nov 1996 - Build a wooden mobile radio mount
Dec 1996 - AOR AR5000
Jan 1997 - ICOM R8500
Feb 1997 - Radio Shack PRO-2045
Mar 1997 - ICOM IC-R10
Apr 1997 - RELM HS-200 portable
May 1997 - Uniden/Bearcat BCT7 virtual downconversion mod.
Jun 1997 - Innovative Scanner Patents of the 1970s
Jul 1997 - Uniden/Bearcat BC235XLT portable Trunktracker
Aug 1997 - Radio Shack PRO-64 portable
Sep 1997 - Stridsberg Engineering receiver multicoupler,
G/Wiz board for EDACS trunked scanning
Oct 1997 - Radio Shack PRO-67
Nov 1997 - Sporty's JD-100 Air Scan
Dec 1997 - Uniden/Bearcat BC895XLT Trunktracker
Jan 1998 - Test Equipment Bargains
Feb 1998 - Innovative Scanner Patents of the 1980s and Beyond
Mar 1998 - RELM MS-200 mobile
Apr 1998 - RCA RP-6150 portable
May 1998 - Radio Shack PRO-2050 base Trunktracker
Jun 1998 - Opto DC442 CTCSS/DCS/DTMF display
Jul 1998 - Stub and Par Electronics intermod rejection filters
Aug 1998 - Sony SC1PC portable
Sep 1998 - Orange Book of Scanner Repair
Tone Out Testing (2-tone generators)
Monitoring ACSB (amplitude compandored side band)

Oct 1998 - AOR AR8200 portable
Nov 1998 - Alinco DJ-X10T portable
Dec 1998 - Radio Shack PRO-91 portable Trunktracker
Jan 1999 - AOR AR7000
Feb 1999 - Radio Shack PRO-2066 mobile Trunktracker
Mar 1999 - ICOM RS-8500 software for controlling the IC-R8500

Note: Reprints of Monitoring Times articles are available for $3.00 each plus a self-addressed stamped envelope from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this reprint fee.

ALINCO

DJ-X10T: 1998 vintage. Rugged construction - metal back. Multimode frequency coverage 0.1 to 2000 MHz (minus cellular bands). 20 selectable step sizes from 0.05 to 500 kHz. Knob atop the radio clicks when rotated and serves as a VFO knob, channel selector, and menu navigation control. Several battery pack options for NiCd and alkaline battery cases. Furnished with an EBP-37N 4.8 V, 700 mAH NiCd pack and a sturdy 11 hour drop in charging stand. Loaded with firmware features and complicated to use. Two VFOs and 1200 channels in 30 banks of 40 channels each. Memory banks are cryptically designated, though you can scan combinations of banks. Each memory channel can be programmed with the frequency, an 8 character label, attenuator, a skip (lockout) flag, and mode (WFM, NFM, AM, USB, LSB, CW, AUTO). Very slow 6 ch/sec scan rate. Rescan delay is about 1 second and cannot be disabled or changed. Auto Memory Write stores up to 40 frequencies but does not check for dupes. 20 linkable search banks with labels. Up to 50 frequencies per search bank can be locked out. Digital clock with on/off timer. Battery saver can be disabled. Ability to scan or search for signals above a selectable threshold or channels with a specific mode. Band scope 7 or 40 steps wide. In short, 30 - 1000 MHz sensitivity is good, few birdies and little intermod. WFM broadcast reception very good. The DJ-X10T squelch can be set to one of 10 levels. We had to keep the squelch set to SQ3 or higher, otherwise it opens at inappropriate times, especially when the battery saver is active. The DJ-X10T instruction manual does not specify the IF (intermediate frequency) scheme. Filters inside the DJ-X10T imply 0.455, 10.7, and 45 MHz IFs. Our tests indicate a first IF of 736.25 or 275.45 MHz, depending on the frequency to which the DJ-X10T is tuned. Our DJ-X10T hears images of cellular phone signals clearly in the 1419.9 - 1444.9 MHz range, 550.9 MHz above their actual frequency. For a full review, including technical test results, see Monitoring Times, November 1998.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features than any other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity, attenuator, AGC, deemphasis, etc. DB9 RS232C connector. Negatives include low contrast LCD display and difficult user interface. NFM squelch closes slowly, causing noise burst at end of each NFM transmission. Electromechanical relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio, otherwise. See "AOR's AR5000 All-in-One Receiver," by Bob Parnass, in Monitoring Times, December 1996, for a review which includes quantitative test results.

AR8200: 1998 vintage. S/N 550004 tested. Portable, high end "super" scanner covers 0.1 - 2040 MHz (minus cellular in USA version). Not a scanner for beginners. Many of the settings are made through the use of menus. Lots of features. 4 AA batteries, steel belt clip, plug-in AM antenna. 1,000 conventional channels in 20 banks, 10 temporary channels, one priority channel. Each memory channel may be programmed with frequency, label, mode, step, step-adjust, offset, attenuator enable, noise limiter, AFC, and write protect. Multi bank scanning. You can enable a 0 - 9 second rescan delay with each scan group, but not per channel. 40 pairs of search limits with labels. Offset capability for monitoring repeater input frequency. LCD display easy to read. Display and keypad backlit using green LEDs. The band scope. Shortwave reception stone deaf on shortwave when fitted with the supplied antenna or a 19" whip. Seriously overloaded on shortwave by a 132 foot long dipole unless we use the built-in attenuator. Supplied "dorsal fin" antenna for AM BCB. Scans slowly (14 channels/s). Requires more current. Audio quality is

slightly above other portable scanners. Computer port. One slot for a single plug-in option: voice inversion descrambler, CTCSS search, 256 frequency tone eliminator, voice recorder and playback, or extended (slow) memory. See AOR AR8200 review by Bob Parnass,in Monitoring Times, October 1998, for review with quantitative test results.

ICOM

IC-R10: late 1996 vintage (serial number 01048 tested). Shirt pocket size multimode is powered by 4 AA penlight cells. Covers 0.5 to 1300 MHz (minus cellular). NFM, WFM, USB, LSB, AM, and CW detectors included. IF bandwidths are fixed. No 30 kHz bandwidth for satellite or FM military monitoring. Battery saver circuit, with selectable duty cycle. Single VFO and 1000 memory channels. There are 900 memory channels divided into 18 banks of 50 channels each. Another bank of 100 channels used to hold unique frequencies found during an auto store operation. 20 pairs of search limits. Up to 100 frequencies may be locked out during a search and stored in a final bank of 100 channels which is cleared before subsequent auto store searches. Each channel can be programmed with the detector mode (e.g., AM, USB), a tuning step size, an attenuator enable flag, and an 8 character label. CI-V computer interface requires extra cost hardware. 7 segment S-meter. Noise blanker. Good sensitivity. Lighted keypad and display, but keystroke sequences are cumbersome.

Good radio hardware in a handy sized package, but scanning performance unimpressive. Very slow memory scanning at only 6 channels/second. Searches at about 16 steps/second, with little or no worthwhile improvement using the "Signal Navigator" feature in the R10 I tested. Rescan delay cannot be disabled. Can only scan one memory bank or all banks, not a combination of banks. No squelch for SSB or CW modes. See "ICOM IC-R10 Receiver," by Bob Parnass, in Monitoring Times, March 1997, for review which includes quantitative test results.

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new

frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the ICOM user with a very annoying clickety-clack, clickety-clack! For Baseband Audio out, I mounted an RCA jack on the back of the R7100A and connected it via shielded cable to the junction of resistors R228 and R230 on the Main Unit. This point is located in the vicinity of IC15 and X3 on the schematic.

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band. Second and third IFs are 10.7 and 0.455 MHz. Weak to moderate cellular images starting near 1106 MHz. Rugged construction. External power supply. DB25 RS232C connector. Audio peak filter. Ok scanning and great searching performance. See "ICOM R8500 Receiver," by Bob Parnass, in Monitoring Times, January 1997, for a review which includes quantitative test results.

UNIDEN/BEARCAT AND ELECTRA/BEARCAT

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency

of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout. See US patents 4,092,594, granted 5/30/78 and 4,114,103, granted 9/12/78 for further insight.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. See US patent 4,270,217, granted May 26, 1981. LED readout. Good scanner, but tinny audio.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC230XLT (Uniden): See BC220XLT.

BC235XLT TrunkTracker(Uniden): 1997 vintage. Portable with 300 channels in 10 banks. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. A query feature identifies duplicate memory channels. Very fast scan and search rates. Scans 64 channels/sec and skips empty channels. Service search. Data skip. Triple conversion, 254.4, 10.85, 0.45 MHz IFs. Excellent image rejection and intermod immunity. Fairly good audio. See "The Uniden Bearcat BC235XLT," by Bob Parnass, AJ9S, in Monitoring Times, July 1997 or an on-line version at http://www.grove-ent.com for a review which includes quantitative test results.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels See US patent 4,270,217, granted May 26, 1981. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100

components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite. See US patent 4,409,688, granted 11/11/83 for further insight.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC895XLT TrunkTracker(Uniden): 1997 vintage. Base with 300 channels in 10 banks. Covers military air band, but other frequency coverage is limited compared with the BC9000XLT. Predetermined AM and NFM modes not selectable. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. Weather alert siren. Built-in CTCSS decoder and tone finder. A query feature identifies duplicate memory channels. Test unit scans 85 channels/sec and skips empty channels. Triple conversion, 380.8 or 254.4, 10.85, and 0.45 MHz IFs. 800 MHz images in commercial and military air bands attenuated over 35 dB. For technical test results and a review, see "The Uniden Bearcat BC895XLT," by Bob Parnass, AJ9S, in Monitoring Times, December 1997.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. For a full review, see "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times. See US patents 4,947,456, granted 8/7/90, 5,163,161, granted 11/10/92 and 5,212,817, granted 5/18/93 for further insights into fast scanning and searching implementation.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan,

search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. NiCd pack provides about 5 hours between charges. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

REGENCY

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band

scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. See US patent 4,057,760, granted 11/8/77. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels

are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Z60: base/mobile sporting 60 channels, but 10 of them are for FM broadcast only. Built in alarm clock, priority, and memory which requires no battery backup. Covers 30 - 50, 88 -108, 118-136, 144-174, 440-512 MHz. Notice that it's not spec'd to cover some important federal bands: 136 - 144 and 406 - 440.

RCA

RP-6150: 1997 vintage. No frills, good performing portable. 200 channels in 10 banks. No military aircraft frequency coverage. Triple conversion and a flexible battery arrangement. Lacks duplicate channel detection, search skip, and empty channel lockout features of newer designs. Our sample isn't super sensitive at 470 - 512 MHz and has some intermod around the VHF railroad channels but is generally more resistant to image problems than the BC230XLT. For technical test results and a review, see "The RCA RP-6150 Portable," by Bob Parnass, AJ9S, in Monitoring Times, April 1998.

RELM

HS200: 1996 vintage. Very good 200 channel portable. 10 banks. Built-in CTCSS and DCS decoder. Lighted keypad. Duplicate channel detection. 100 frequencies can be locked out from search. Very good audio and strong front end. Excellent internal shielding. Global rescan delay. Covers CB. Fixed modes and step sizes. IFs are 280.2 and 0.45 MHz, and perhaps one in between. See "The RELM HS-200 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1997, for a review which includes quantitative test results.

MS200: 1998 vintage. Made in USA. 200 channel mobile with alpha labels. CTCSS and DCS decoding squelch. Programmable via PC using supplied software. Low contrast, LCD display. Keypad backlit for night programming. Rear panel tape audio jack. Test unit had lots of intermod on VHF-high band. IFs are 280 and 0.45 MHz. See "The RELM MS-200 Scanner," by Bob Parnass, AJ9S, in Monitoring Times, March 1998, for a review

which includes quantitative test results.

RADIO SHACK

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 crystal controlled portable bearing the same model number.) Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were

used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range. IF frequencies are specified at 608.005 - 611.2 MHz, 48.5 MHz, and 455 kHz.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-62: 1994 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO-64: 1997 vintage. Good portable 400 channel scanner using up conversion. Replaces PRO-62 and has many more features. Selectable AM/NFM modes but fixed step sizes. 10 search banks which can be cascaded. Auto store saves unique frequencies found during a search. Frequencies can be loaded using a computer but optional interface kit not yet available. Can recharge Radio Shack's optional, monolithic NiCd pack, but not AA cells within the scanner. IFs are 257.5, 21.4, and 0.455 MHz. See "The Radio Shack PRO-64," by Bob Parnass, AJ9S, in Monitoring Times, August 1997, for a review which includes quantitative test results.

PRO-67: 1997 vintage. Good portable 200 channel scanner using up conversion. Replaces PRO-51 and has better image rejection and super fast scanning. Service Search lacks police frequencies. Fixed AM/NFM modes and step sizes. Can lock out up to 20 frequencies during a search. Can recharge AA cells within the scanner. Frequencies adjacent to the cellular phone bands censored so our PRO-67 will not receive 868.9625 or 823.9625 MHz. Intermediate Frequencies are 254.4, 10.85, and 0.45 MHz. See "The Radio Shack PRO-67,"

by Bob Parnass, AJ9S, in Monitoring Times, October 1997, for a review which includes quantitative test results.

PRO-91: 1998 vintage. Portable made by Uniden for Radio Shack. 150 channels in 5 banks. Can selectively follow conversations in 800 MHz Motorola trunked radio systems. Censors 823.975 - 823.95 and 894.0125 - 896.1 MHz covered by the BC235XLT. Powered by four individual AA alkaline or NiCd batteries. Power save feature. Program key. One priority channel/bank. One search bank. Direct search. Service search omits many police freqs (inc. 460 - 460.5 MHz). While connected to an outdoor antenna, our PRO-91 experiences intermodulation interference in the 161 MHz range from a paging transmitter on 158.1 MHz. IFs near 380.7, 10.85 and 0.450 MHz. See PRO-91 review by Bob Parnass, in Monitoring Times, December 1998, for review with quantitative test results.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan.

Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Somewhat prone to intermod in the 460 MHz range. Cellular images throughout the 847.6 - 869 MHz range. See September 1996 Monitoring Times for modifications.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The

Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2045: 1996 vintage. Very good 200 channel base/mobile made for Radio Shack by Uniden. Tuning/channel selector knob. 10 banks, selectable attenuator, and rescan delay. CTCSS-capable with optional board. Great Auto Store. Weather alert. Scans and searches fast. Can lock out 50 frequencies during search. Step sizes fixed but AM and NFM modes are selectable. IFs are 380.7, 10.7, and 0.455 MHz. Images on VHF-high band despite high 1st IF. Some intermod on review unit. See "The Radio Shack PRO-2045," by Bob Parnass, AJ9S, in Monitoring Times, February 1997, for a review which includes quantitative test results.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels.

Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in Monitoring Times, October 1996, for a review which includes quantitative test results.

PRO-2050: 1998 vintage 300 channel Motorola trunk system tracking base made by Uniden. Tight front end. Excellent performance. Chassis-less, plastic construction. Squelch and volume knobs too close and Manual key is hard to find. IFs are 380.7 (approx.), 10.85, and 0.45 MHz. AM and NFM modes are factory set and not selectable. 300 channels in 10 banks and a 2 second rescan delay may be programmed on a per channel basis. Query feature identifies duplicate memory channels. Our PRO-2050 scans at 78 channels/sec., skipping over empty channels. 10 priority channels. Up to 50 frequencies may be locked out from limit search. A single pair of limits may be programmed for a limit search. No Direct key or direct search facility. Factory preprogrammed frequencies for police, fire/emergency, commercial air, public service, and weather, but not marine. See May 1998 Monitoring Times for a review which includes quantitative test results.

SONY

SC1PC: 1998 vintage. Good RF and audio performance. Covers 25 - 1300 MHz, minus cellular phone. Selectable step size and mode. Computer control and downloading with software and PC cable provided. Powered by ordinary AA batteries. Provided CDROM includes both the scanner control program and the multi million record PerCon FCC license database. 10 banks ("pages" in SONY parlance) of 30 channels each. Per-channel 2 second rescan delay. Unlike the ICOM IC-R10, you can scan any combination of memory banks. You can lock out ("skip") memory channels from scanning. The frequency stored in a skipped channel will also be skipped during searches. One priority channel checked every 5 seconds. SONY's limit search is restricted to one pair of search limits, though computer control expands this to 20 linkable pairs. Band search lets you search through 17 bands programmed at the factory. Service search. A cache, termed Intelligent Memory, stores the last 10 unique frequencies that were active for longer than 5 seconds each. IFs (in MHz) are 600 (below 370 MHz), 232.5 (above 370 MHz), 45.0, and 0.455. See "The SONY SC1PC," by Bob Parnass, AJ9S, in Monitoring Times, August 1998, for a review which includes

quantitative test results.

SPORTYS

JD-100: 1997 vintage. Limited 20 channel scanner which covers civil and military air bands only. Good audio. Large display shows frequency only out to 2 digits. Slow scanning and odd keystroke sequences. No key press confirmation beep. Cannot lock out channels from memory scan. Powered by AA batteries. Battery saver circuit. See "Sportys JD-100 Air Scan," by Bob Parnass, AJ9S, in Monitoring Times, November 1997.

CRAIG (division of PIONEER)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

SONAR

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no

scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Model	Sonar #chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X		no	
FR105	6	X		no	
FR2512	24	X		no	
FR2513	24	X		no	
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2516	10	X		yes	yes
FR2517	10	X		yes	yes
FR2525	10	X		yes	yes
FR2526	10	X	X	yes	yes
FR2527	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

TENNELEC

Manufactured the first synthesized scanners. See US patents 3,961,261 and 3,962,644, granted 6/1/76 and 6/8/76 respectively. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel

programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state,

and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central

time. For a brochure, send SASE.

How to Obtain Copies of Patents

Printed copies of US patents may be purchased for $3 each, but you must know the patent number. Credit card orders are taken over the telephone by the Assistant Commissioner for Patents at (703)305-4350. Alternatively, you can mail a check or money order, made payable to "The Assistant Commissioner for Patents" to

The Assistant Commissioner for Patents
Washington, DC 20231

For more information about the US Patent and Trademark Office, call their automated information message system toll-free at (800)786-9199.

There are various patent servers on the world wide web, including IBM's server:

Not easily. It's sort of like asking if you can modify a moped to go 100MPH. It can be done, but at a much higher cost than it would be to go out and buy something designed to do so, not to mention the time/frustration factor.

You would need to basically build your own AM receive circuit and then interface it somehow with the scanner's CPU so that it would select and use the AM circuit when you entered a valid VHF-AIR frequency. Then, you still haven't tackled the issue of how to bypass the CPU's firmware that tells it not to accept said frequency. Assuming that you can somehow manage THAT one, now we've got to stuff it all back inside this cramped handheld case that barely had enough room for the original parts. By this time, you'll be ready to beat your head against the wall (WHY? because it feels better when you STOP!)

Of course, there's another option that you may not have thought of. If you have a shortwave radio, there's a trick you can do:

1. Tune the scanner to an IMAGE of the desired air frequency (120.900 becomes 142.7000, 21.8MHz higher or 2X your scanners' IF)

2. Tune your shortwave radio to the IF of your scanner, 10.7MHz for example

Now you'll hear the air band frequency you wanted. Cool huh?

-Phil

5324. BC700A failure

Newsgroup: rec.radio.scanner
Date: 1999-03-30 00:00:00 UTC
From: "Clifton T. Sharp Jr." <clifto@megsinet.net>
Message-ID: <370171A0.2B52@megsinet.net>
Source record: 123656

I'm an experienced technician with no service manual, and a BC700A that has a problem. While scanning, it will stop on a station and stay for five seconds to two minutes, then the sound will distort and go down in volume to nothing but a little scratchy noise. It then scans around, comes back, finds the *same* signal and does the same thing. Opening the squelch completely changes nothing, except that when it scans it stops on the next channel in sequence rather than on the next signal. It will *sometimes* make the signal come and go while staying on the channel.

I can put the unit on "HOLD" and it will stay indefinitely on the signal with no problem. The moment I go back into scan mode, that same signal starts disappearing again in the same way. In the cases where the signal comes and goes while staying locked on the channel, putting it in HOLD mode stops the come-and-go.

I have identified at least ten different signal sources that the problem happens with, so it's not the source going away (especially as evidenced by the fact the open squelch won't keep it on that channel). Power is a perfect regulated 13.8 volts (Fluke 77 measurement) from a known-good power supply that also powers my talkie charger and GPS just fine. Going from outside J-pole to inside whip doesn't help either.

> this newsgroup probably means they don't care.

Or didn't know.

The "clauses" you're looking for are the reason both your newsreader
software and your ISP probably tried to get you to read the newsgroup
news.announce.newusers. That is the first place you'd have learned that
binaries don't belong outside alt.binaries.*.

Look at <ftp://rtfm.mit.edu:/pub/usenet/news.announce.newusers/How_to_find_the_right_place
_to_post_(FAQ)>
and search for the second occurrence of the string "binar". There you will
find the official word:

"Do not post anything other than plain text in non-binaries groups. If
the group does not have the word 'binaries' in its name, do not post
binaries there."

So please don't encourage people to post binaries, as you did earlier in
this thread by saying

> Thanks for the files. Feel free to ignore those losers who think this is a
> text only newsgroup.

I sure would like to get a copy of winflex sent to me too!
Or, if someone posts it overseas where MOTO cant grab'em, please post a note here
so we all can get it!!!!!

Thanks!

I WILL NEVER USE EBAY AGAIN!
SCREW EBAY!

Knowledge is power, and some people do not want you to have the knowledge
that a scanner can give you. Ebay shows porn, but they won't allow you to
purchase a scanner it appears.

The Scout only will pick up FM transmissions. It will not detect AM or PCM transmitters. Transmitters such as door openers and car alarms are not FM.

> What gives? Shouldn't the Scout have been able to detect the frequency
> being used in the drive-thru? And how come it ignores the garage door
> and car alarm transmitters? Is my unit defective?

> Scott Coleman, President ASRE (American Society of Reverse Engineers)

The Scout is also very antenna dependent. It will only detect within the window you give it. I very rarely get anything below 400MHz with the included antenna.

5347. Annoying squelch tail on Uniden-made scanners

Newsgroup: rec.radio.scanner
Date: 1999-03-30 00:00:00 UTC
From: inpursuit@thespeedlimit.not
Message-ID: <37029896.1426630@news.pacbell.net>
Source record: 123689

I noticed that every Uniden-made scanner in my collection (other than my Pro-46 and Pro-2026) has a noticeable squelch tail, whereas the GRE-made scanners I have don't have a squelch tail. There is a combination beep disable/squelch tail mod for the Pro-51, and it worked great on mine, but I haven't seen any other mods for getting rid of the squelch tail on Unidens. The last two scanners I bought have the longest squelch tails I have ever heard (with the exception of an unmodified Pro-51). These are the Pro-2046 and Pro-2056. I know that there is a common mod to disable keypress beeps on most scanners, and I have done that mod to numerous GRE and Uniden-made scanners. Is there a simple way to find out which resistor controls how long the squelch remains open after a carrier drops? The Pro-51 mod involved removing a resistor from the logic board (beep disable) and connecting this resistor in parallel with the resistor on the RF board that controls how long the squelch remains open after a carrier drops. Why can't Uniden spend a few CENTS more and remove the squelch tail from their scanners?

Spamblock in effect. Reply in newsgroups.

5348. some WINFLEX thinking?

Newsgroup: rec.radio.scanner

Message-ID: <7dqc06$7en$1@nnrp1.dejanews.com>
Source record: 123690

Hello,

Something to think about.

About a year ago someone is writing a very nice pice of DOS software
with the name POCFLEX.
About 6 months later someone else introduce a windows based program doing
the same routine, and give it the name WINFLEX.
The WINFLEX program is there for nearly 6 months !!!

About 14 day's ago,
POCFLEX put a link on there pages to WINFLEX.
About 7 day's later,
WINFLEX is gone "due a legal matter".
But POCFLEX is still there and for almost 14 months now !

This is just something to think about ?
Or someone can give a good explanation about this strange matter ?

So we like to get back 'our' WINFLEX program.
Is there someone having some idea about this ?

Digicode.

The overall utility of this receiver far outweighs your concerns (except for crashing ;-)

It may not be the best first scanner if you want a keypad but it is a definite winner as second receiver, especially for it's PC programmability.

I sit here reading e-mails from users in this group asking how to do a
mod for a scanner and all they get is a bunch of its illegal to do ok
users let try this its not illegal to listen to the cell band but you
cant tell everyone what u hear...all scanners produced after 1994
cant br moded for the cell band anyway...so buy a used one that has the
mod done or one that receives the band outright....
remember you cant do it but big brother can....they are even listing to
you calls from home.....this gov. has to much power.......good luck
scanner listners........we still have a little time left before this
hobby will be dead..............replys welcome

5362. HELP ebay & scanner law

does someone know if it is legal to sell a scanner with cell
like my icom R100
i put it on ebay and they took it off because of that
i cant find the law on it on the web i know you cant sell new ones but how
about the ones before the law was passed
thanks

From: Bob S <bob9000@concentric.net>
Message-ID: <3700E8E9.F56C419B@concentric.net>
Source record: 123707

I am puzzled. I just got both an R-2 and an AR16 and with stock antennas, the AR16 picks up Fm radio on 93.1 but the Icom barley can hear it with the squelch wide open. Tried switching antennas, but same results.

5366. Buying from Bills 2 Way.

Newsgroup: rec.radio.scanner
Date: 1999-03-30 00:00:00 UTC
From: marb@beatricene.com
Message-ID: <7dqtfp$mm3$1@nnrp1.dejanews.com>
Source record: 123708

I was very happy about Bills 2 Way having most of the items I need at the prices that were affordable. I do find it odd though, that a 5lb package cost me 11.18 shipping when it should have been 4.87, and that a 3lb package that came the next day was 11.18 also, which it should have been 4.13. These were both sent Ground UPS, The bill of lading said shipping, no handling or packaging, I could give them a little extra for insurance. But that would not have been the big difference. Watch and ask what shipping is before you jump. I did not. I am happy with the things I bought, but add on 13.00 I believe I was overcharged and then his prices do not look so good. I used a Credit Card. Well if this helps one of you fine. Next time I will ask specifically. I send radios and parts all over the country, and have yet to make a living gouging on shipping. Byron

It's fine. I sold mine on there and got $675 for it!! ;)

If the scanner was manufactured before the laws went into effect, it's grandfathered. No one can stop you from selling it. If it was something "modified" after the fact.....it's a different story! To the best of MY knowledge, there was no way to modify that radio FOR Cellular if it didn't already have it!

(I miss mine though..... ;)

Don't worry about it.

5369. Russian UHF Voice comms

Newsgroup: rec.radio.scanner
Date: 1999-03-30 00:00:00 UTC
From: we@bulldog.org
Message-ID: <7dqrkd$1kd$1@news.uky.edu>
Source record: 123711

The January 1999 issue of "popular Electronics" lists some Sovie Er
Russian Narrow FM milsat (theirs not ours, I think) on:
258.45MHz
265.45MHz
268.45MHz

I aimed my homebuilt 250MHz Yagi/Preamp toward the southeast, where I
would suspect the Russians to have a milcom bird. Sure enough some
weak Russian(or some other slavic language) voice coms where present
right around 265.45. There was some spanish at 266.20.
Since most folks do not have a yagi, try a standard VHF TV antenna.
I have received some US milsat comms using a friends TV antenna.
Good luck
And if there are any Russian speakers out there to translate the stuff
it might be interesting.

Okay, I know, way off topic and cross posted, but the WSJ and New York Times said this episode is hilarious....

ABC Show: "It's like you know"

Wednesday, March 31 (8:30-9:00 p.m., ET) - "The Getaway"
Arthur, Shrug, Robbie, Lauren, Jennifer and all of L.A. are glued to the set watching a televised car chase, but Jennifer worries that the premiere of her career-reviving TV commercial will be preempted. (CLOSED-CAPTIONED) (TV-PG,D)

Bit of dry humour from me :-)

>I didn't post any binaries.

I know ... I was just using your post as an entry point into the
thread ... and you were the person who the files were for it seems
(from your "thanks for the files") so I thought my information would
be of benefit to you.

>Don't recall any clauses such as what you referred to with my ISP. Bet you
>couldn't prove that generalisation. The fact my ISP carried the binaries in
>this newsgroup probably means they don't care.

I'm not trying to pick fights or anything, I was just pointing
something out to you, that's all. And it is in your Terms and
Conditions, it certainly is with my ISP.

>But I nearly gagged on your loose attempt to educate me.

Well, it seems you've taken it the wrong way and jumped on the
offensive. I tried to be nice about it, evidently you can't return
the favour ... a pity really.

Hello,

I'm planning on purchasing a couple of receivers.I have already decided on the BC-245 XLT when it becomes available because of the Trunk Tracking feature.I have narrowed my other choice down to the following combinations (I have $800 to spend):

AR-8200 ($540) + Case ($25) + Jav232 Interface & Lead ($125) + Memory Slot Card ($70) = $760

OR

MVT-9000M3 ($515) + Case ($25) + Cub Frequency Counter ($150) = $690

OR

AR-8200 ($540) + Reaction Tune Cable ($20) + Mini Scout ($250) = $810

OR

MVT-9000 ($415) + Case ($25) + Scout ($350) = $790

OR

Optocom Imported Version (No Gaps 760-1300) ($650) + Cub Frequency Counter ($150) = $800

OR

Scanblaster 1 Pack Direct from Optoelectronics:Includes Optocom (Cell Blocked),Scout,Reaction Tune Cable,DB32 Mini Antenna,TA100S Antenna,CC30 Carry Case, and CC50 Carry Case. = $800

I would like to have computer control but Receiver performance is more important to me.I like receivers with very good sensitivity and dynamic range.I would also like to use the receiver for Medium wave reception,so that is another factor.It would also be nice to have reaction tuning but it really isn't that important to me.Also,I don't listen to cell frequencies but I have some kind of mental hangup about buying a receiver that has frequencies "blocked".It may sound stupid but its just one of those personality flaws.

Please post some opinions or recommendations concerning the Positives and Negatives of each receiver.

Thanks,
Joseph Gallelli

>73's

This is the kind of discussion that has created the sudden total loss of cell capable scanners on Ebay. As much as I am opposed to the restrictions being invoked on radio listening in this country, keep in mind that until we, as a hobby, legally overturn these silly laws, they are still The Law. And as such, enforceable.

The Feds know that European scanners are being imported into this country, but absent hard evidence, they have little to act on. Discussion of the sources and the mechanisms for smuggling these radios into the country in such an open and public forum is all the evidence they need to focus their efforts at enformcement. It invites heavier customs inspection, and seizure of this expensive contraband. Discussion of actual dealers only makes their job easier--telling them which boxes to look in.

C'mon, guys,...think...Civil disobediance is a time honored tradition in this country. But doing it this way is closing down not only your own intended result, but cutting you off from the support you need to be effective.

Write your congressmen. Knock on his door.
Document the cases where scanners have made a difference in saving a life. Or, as the founding fathers intended with the press, document the cases where public access to public service communications has resulted in the prosecution of a corruption.

The major event that has sealed the cell frequecy issue was the conversation overheard between Newt and his cohorts. Now, I'm not a Newt basher, in fact, I'm one of his biggest supporters, but the fact is what he was doing in that call was unethical, if not illegal. It was an attempt to circumvent the terms of a punishment to which he had consented. A free right to receive these frequencies, as well as others in the public service, keeps the public servant answerable to the public, which is what this Republic was based on.

Make that case. Document others...but don't turn this into a crackdown by arrogantly flouting the law through open discussion of the intent to evade it. You'll only defeat yourself, and you'll alienate the dealers who might support you...the dealers who then have to deal with investigations as well as lost revenues when the authorities turn on them as accomplices to these acts.

Bob Grove stood up to Congress. Made quite a compelling argument, but not even he can withstand the administrative harrassment should the authorities turn their attention on his business. And he modified his business as a result.

Its your choice, obviously, but you want the feds in your hobby? Keep talking.

>After having owned every antenna mentioned on this newsgroup, I would,
>with out hesitation give the top award to the Monitenna by Channel
>Master.

I myself have try them preaty much all, and whould have to agree that this atenna is by-far the best one that i have found for the money. The only thing that I found to help this antenna to work even better is to change to an RG/8-u cable for runs longer then 50 feet, with a "Radio Shack"- 20 db ant. amplyfier for 450 to 1000mhz it goes for around $29.00..You will have to buy a couple of different fitting to make it work to match the cable to the ant. (note) my antenna is fifty feet up with a 100ft cable run to a Uniden Bearcat BC895XLT and i can recive up to about 70 miles a way and still trying for futher. good luck

I wouldn't wait too long. I thought they would be junk, bought one on a whim, and find it to be very good. Decent audio for a modern scanner.

Use an external speaker with this one, however. You will need a sophisticated (will filtered) power supply to use it as a base, but it is a great mobile.

Uniden Bearcat 760 XLT, solid steel case mobile / base scanner with CTCSS board installed ! Easily set up your PL tone requirements right from the front keypad on the scanner.

CTCSS programs easily and can be turned off with switch on bottom of unit.
This is a Uniden option, not a hacked modification.

The radio has not been modified to restore cellular reception, but is capable.

Yeah but writing the software is not illegal is it ?. If anybody was
threatened with losing their job if they work for a telco or comms chip
maker because they wrote some decoding software thast would be good grounds
for suing them wouldn't it ?.

5418. UHF FREQUENCIES FOR B-52s AT RAF FAIRFORD

Newsgroup: rec.radio.scanner
Date: 1999-03-31 00:00:00 UTC
From: Andy Carter <Andrew.C.Carter@btinternet.com>
Message-ID: <7dtnffjga1@plutonium.btinternet.com>
Source record: 123536

Hi there,
I'm living North of Bristol, a good few miles from RAF FAIRFORD but am still looking to listen to the current B-52 operations in & Out of Fairford, particularly as B-1Bs are expected here imminently.

I have what I believe are current Freqs for Fairford / Brize Norton, but have heard very little - The only communication I have heard is Brize Norton approach on 342.45, where I have heard 52s using the callsigns 'Havok' and i think 'Edwin'

Due to the distance from Fairford, Tower & Ground frequencies will not reach me from here, but what I want to know is, after Brize approach, what frequencies do they use when they depart, and also on their return ?

Have looked at
http://www.flash.net/~av8tor/radios/kosovo1.htm , and

http://www.geocities.com/SiliconValley/Horizon/9163/arc.html

which do not unfortunately shed any light.

If anyone has been tracking these bombers down across the UK and can provide me with frequencies being used I would be very grateful

Andy Carter

Hi all,

I'm looking for the 800mhz frequencies for the Saanich Police, located
in Victoria, BC, Canada.
I have some (all?) of the freq's just from listening, but since they are
a Type I trunked system, I also need the correct fleet map.

I currently have a Radio Shack Pro-90 scanner.

Any help is greatly appreciated.

Many thanks
Mark

Hehehe - cuz they're boobs who don't know what the hell a cell-phone really is (a radio in the 800mhz range). Boobs. These are the same type of people who think all scanner owners are cantakerous old dudes, criminals up to no good, or techno-geeks with a need to know what's happening everywhere. Also the same ones who want to take our right away to listen to fire, police, public svcs, etc. Just my 2 cents today.

Excuse me Barry, the price you quoted doe not include shipping. Perhaps someone out there doesn't mind paying $375 for a brand new unit because it is already safely here in this country. Maybe, they don't want to risk forfeiture, so they pey the few bucks difference. It just might be worth it. But hey, that's just my opinion.

Yeah, but it looks like a few are slipping though the cracks. I saw a couple of 2006's that have been going for a couple of days now. I wonder if they'll get yanked before the end date.
As a side note, I received e-mail from amazon.com today announcing their new auction. I have bought books from them in the past, so I am already registered. It looks almost like Ebay. Here is an excerpt of the e-mail I received, and from what I can tell, they are not censoring items put online for sale.

>Auctions is something truly different for Amazon.com. In the
>past, when you bought something at our store, you were always
>buying directly from us. Now, with Auctions, our community of
>almost 8 million customers (including you--thank you) can

>possible. You'll find rare books and signed first editions,
>rare music, vintage toys, antiques, sports memorabilia,
>collectibles of all kinds, etc., etc.

Guess Ebay isn't the only kid on the block. Amazon.com gets a lot of hits, and I imagine their auction site will become successful.

Then you're missing alot:

POCFLEX...
Winflex....
MDT Monitor....

They all work just dandy with MY 895..... When the 245 comes out, I'll probably use the 895 just for data. In fact, I think I'll experiment with trunker on it tonight.

No you can't! Posted on CEI's site:
Due to the high demand for the BC895XLT, this scanner is currently sold out
until April 8, 1999. Reserve your scanner from CEI today.

Oops. Add to that the fact that I'm sure they don't ship it for free....

Check your sources, it is and always has been Private Line.

I quote from the Contents Page of the Spectra RSS User's Guide:

"...Privacy Plus, Private-Line, Digital Private-Line, Channel Scan, ...are
trademarks of Motorola."

I quote from page G-2 (Glossary) of the same manual:

"DPL An acronym for Digital Private Line."

There are innumerable references in Motorola literature about Private Line.

Sorry....

Source record: 123575

Anyone have one? I have one and although I think it has all I would ever want or need in a scanner as far as capabilities and functions, I consider it useless because it doesn't pick up all the different freq's in scan mode. If I want to listen to a freq, I usually have to listen to just that freq because I have to constantly adjust the squelch. It makes 'scanning' impossible.
Is it just my scanner or does the 1000XLT have a history of this sort of thing. Please post or respond in laymans terms. I enjoy scanning very much but have no clue when it comes to technical mumbo-jumbo. Thanx.

WELL WELL! We can see the ebay is politically correct, and pro-big government because they think they should be able to make sure that you will use their items legally!
Do you find this an invasion of your privacy by ebay?
Can you imagine how many items Americans could not purchase if the fucked up government had to make certain that it played mommy and daddy and watched over us and prevented us from buying things we might misuse?
Ebay sucks, and I will never purchase a single thing from their site, nor will I honor their advertisers. SCREW YOU EBAY! YOU ARE A BUSINESS, NOT OUR PARENTS, YOU BUNCH OF LIBERAL IDIOTS!

The very width of the frequency range that you specify precludes most types of gain antennas, other than maybe a very expensive log periodic type. Your request is just not realistic.

This is something that every scannist has to deal with sooner or later. I think the only real solution is to decide just what frequency bands interest you the most, and then concentrate on them. You can then build "gain" antennas for those bands, Using maybe multiple scanners or computerized antenna switching to achieve the best result.

You have to realize that your discone has very little gain on any frequency, so an antenna that IS tuned for a particular frequency band is just going to work a hell of a lot better !

You could use a TV antenna turned vertically, they are a log periodic design, but even they have their limitations. There is no free lunch here.

Radio Data, Link Access Protocol.
As you can see, there is much controversy over this software and the legalities of using it. I suppose it's not illegal to write it, it's the use of it. However, what good is writing it if you can't use it? Then again, that is the essence of a good old hack!

Open Broadcasting, the somewhat stretched campaign to preserve open public safety communications, has had a listserv utilizing the Listbot service for quite a while. To encourage new subscribers I have "fronted" the entrance to the Calling All Citizens home page with a subscription page that links off to the actual content.

Scannerists know the value and perhaps some of the vices involved in utilizing open police communications to make them safer and more informed. Join this list or get the low down on this by visiting

From: Bill <k9kz@indy.net>
Message-ID: <7dsbal$8v1$1@news.indy.net>
Source record: 123595

I was thinking about getting a new BC9000xlt from CEI for $315 + shipping. This price seems low. I was wondering if they're coming out with a new model. I remember when the 9000xlt was close to $400 at some places. Is CEI a good place to buy this radio? Is there a better scanner than the 9000xlt on the market for this price? Thanks!

these scanners are in mint shape and super clean
never abused and treated like babies.
1) pro 2046 from radio shack/uniden $155shipped
scans 29-54, 108-136.975, 406-512, 806-823.9375, 851-868.9375,
896.1125-956mhz. preprogrammed bands police, fire, emg,dept. of
transportation,highway, public service.picks up cell harmonics from 899-924
double conversion.
2)radio shack pro-90/uniden $175shipped
mint super clean you could even trade it back in to radio shack
thats how clean it is.have new leather case to give u with
it.everyone knows the
specs if you dont read the radio shack catalog.

Just received my Opto Scout today. I'm a little puzzled by how it functions. Just to test it out, I tried a few RF transmitters I have lying around the house. First I tried my garage door opener - nothing. Then I tried the remote transmitter for my car alarm - still nothing. Starting to get a little worried, I then keyed up one of my ICOM 4008As - BOOM! Full signal strength, locked right onto the frequency. Then I tried a 900MHz cordless phone - again it locked right on.

For the first real test, I drove over to the local Jack in the Box and parked in the parking lot. The Scout picked up nothing. So I drove through the drive-thru and ordered a Coke. Still nothing, even though I was 1 foot away from the clown box. The Scout was in the passenger's seat, on my wife's lap, the window was down, and the car is a convertible with a soft top, so there wasn't a whole lot to block any radio waves from getting to the Scout. When I got around to the window, I saw that the store employee was wearing a headset and the standard-looking black box on his belt. The Scout was in filter mode, BTW, and I was using the Opto DB32 stubby antenna.

What gives? Shouldn't the Scout have been able to detect the frequency being used in the drive-thru? And how come it ignores the garage door and car alarm transmitters? Is my unit defective?

Scott Coleman, President ASRE (American Society of Reverse Engineers)

Actually, it'd be almost impossible to write it without using it;
unless you're an absolutely brilliant programmer whose code works
perfectly the first time you compile it, during development you're
going to need to TEST it. ;-)

I recently bought one of these, and I also argee that it is a nice unit. I do have a question though. I have installed 5 mobile scanners since I got into the hobby (6 or 7 years) and have had absolutly no trouble. But with this unit I get a very quiet whine that increases in pitch but decreases in volume as I speed up. By the time I am at highway speeds you can't really hear it, but 15 mph and lower it is a bit annoying. I could live with it, but would like to have it taken care of. Any ideas?

writes

Hi,

>Is there anybody hou can tel me to mod a Pro 26, so i can recieve 86 mhz

The European PRO-26 (RS Cat# 20-9506) has continuous coverage from
25-1300MHz and no modification is needed to receive 86MHz.

If you have a US version of the PRO-26 (20-0506) then the default step
size when entering 86NHz is 6MHz. You may have to change the step size
to for it to accept the exact frequencies you are trying to receive.

Cheers,
JC

>i mean its a "no gap" radio with AM,FM.WFM which i dont know how to work
>either by the way .

The 3000XLT (BC- or UBC- variant) has coverage starting from 25MHz. If
you are referring to local AM Broadcast transmissions on Medium Wave
then I'm afraid the 3000XLT will not receive them. These are from 530kHz
(0.53MHz) to around 1800kHz (1.8MHz).

As for the AM, FM and WFM modes the 3000XLT will select a mode when
entering a frequency which will in most cases be correct but you can
manually override this selection.

Cheers,
JC

I have the following Radio, and electronic equipment for sale. Will consider trades for Computer or Electronic EQ. All working last time tested unless noted.
Shipping is extra.
Thanks

Tempo-1: Tube type Ham Transceive with Power Supply.Covers 80-10 meters. Looks good and works well. $200

Pearce Simpson: Guardian 23- All tube CB Transceiver/with mobil power cord and mounting bracket. Looks and works Good. $100

Lafayette: HB444/25A Looks and works great. This is an all tube 25 channel base unit with a nice chrome trim all around. would rate an 8 in looks. I think the mobil mounting bracket is also included, with nice heavy cast alum mic. $125

Channel Master: Tube Stereo Receiver (Model 6612) and matching amp (Model 6601) Looks good and plays on FM only. AM not working. $125

Non Tube Items:

AR Inc: Stereo Amp, All solid state with the optional wood case.I would rate the appearance as an 8. $100

Traynor: Group Two B- Audio Amp Head. High/ Low mic. in puts. Master volume, volume, bass, treble and tone shaper controls. All solid state $125

Swan 14X DC Power Supply Module: No way to test but was told it was working OK. As is $50.

Swan Phone patch: with hook up cords. This unit looks real good, but is also untested. As is $35.

Siltronix Model 90-6 VFO: Excellent condition with three position crystal switch $75.

PRO 2003 Scanner: Radio Shack 50 channel(30-512 Mhz.) digital Scanner with FM broadcast band included. Have two, one is working the other is a complete non working unit. $200 for both.

Bearcat 250 Scanner: Have two. One working and one for parts. $75 for both.

Bearcat 210XL and 220 Scanner: One of each complete, but not working. $25 each.

Kenwood MC 50 Mic: Works OK and comes complete with cable and input jack. $50

I can't tell you about Iceland but here in Greenland you will be a "close" neighbour :-).

I get all the normal frequencies but NO acars :-(. Since Iceland once was Danish Territory (As Greenland still are) U might wan't to have a look here http://www.dkscan.dk. U will have to read it in danish but the Author is a very competent guy.

Drop me a line if U need some translations or if u need me to do some Searching.

I don't know about the legal bit. But I do now that it is Illegal in Greenland since they got their homerule Government and the laws are not parrallel to the Danish laws regarding scanners. It might as well be the same regarding Iceland ?

> model.

Hard to tell. Current rumors are that Uniden will be introducing
some upgraded base models this fall. Exactly what is way open
for debate.

> I remember when the 9000xlt was close to $400 at some places.

Trust me, there are still a LOT of place that will charge that
amount for this radio. I bought mine a few years ago...believe
from CEI for $340.

> Is CEI a good place to buy this radio?

If you ask me, yes. Stop by my Dealer Survey page to read
up: http://www.strongsignals.net/htm/dlr_srvy.htm

Just be aware of their hefty shipping charges. Regardless,
you'll probably find that their FINAL cost is lowest. Other
places will charge, say, $10 for shipping but $330 for
the radio. You get the idea.

> Is there a better scanner than the 9000xlt on the market
> for this price?

Ask ten different people and guess how many different
answers you'll get? ;-)

It is a good radio. I personally have better likes...
such as the PRO-2042 but they are no longer made by
Radio Shack. Have to get one used if you wanted to go
that route.

You should seriously consider the BC895XLT. Different
features than the 9000 but it does do TrunkTracking,
has an S-meter, weather alert and computer control,
and standard CTCSS decode/search.

Best of luck with your decision!

5496. Opto R10 & Opto Scout

Newsgroup: rec.radio.scanner
Date: 1999-03-31 00:00:00 UTC
From: Steve <nospam@ooo.com>
Message-ID: <7dt78v$171$1@hornet.fibr.net>
Source record: 123617

Could someone give me details about the Optoelectronic R10? And, will the Optoelectronic Scout tune the Opto R10?

Thanks,

Steve

Doc,

What is your location? Perhaps someone in the group can give
you a few frequencies to start with.

Only a guess, but you may have wear on the Chomerics Scan Button keypad dome.
Also possible is oxidation/corrosion on the "zebra strip" from the keypad to the display
PCB. Have observed some zebra strip sockets that are unable to make good contact
to the metallized plastic as well. Might try the #2 Pencil Eraser (lightly!) on the strip contacts.
Suggest you either replace the scanner outright or try new keypad - try Gerry at G&G
Comm. (716) 768-8151. Sorry, our replacement keypads totally exhausted.

You have an older one. The newer ones are not type accepted and no longer have the type acceptance label. If yours can be front panel programmed, it is illegal in the U.S. regardless of what the label says.

Hi Scott,

I believe that a garage door opener and car alarm are in the 300 MHz range and that they are pulsed singles. They are not transmitting for very long at any one time. They tend to pulse their signal on and off very fast.

The Scout is very deaf and needs some power to trip it's counters. For example, a cordless phone will need to be almost next to the Scout to trip it. Although stronger signals such as a FRS radio or commercial radio will cause it to capture a frequency. Usually anything that transmit more than 150mw will cause the Scout to capture the frequency with in some reasonable distance (100 feet?)

Keep using it. People who use commercial radios (malls, events, police....) will trip the scout within a 1/4 of a mile.

Have fun!

Monte---

Joel (Joelsemail@email.msn.com) wrote:
: joelsemail@msn.com

The vast majority of scanners will receive the forbidden frequencies as "images", when the scanner is set to a frequency outside the blocked range. I'll even go almost as far as saying all of them can do this.

On the lower cost ones, simply add 2 times 10.7, or 21.4, to the frequency range you want to listen to. You won't pick up all of them, but enough from a local tower with a triangular top to keep you hot little ear happy almost all the time 24 hours a day. Some of the more expensive triple conversion ones you have to figure out what the first IF is and add twice that amount to the frequency you want to tune in to.

This whole business about blocked and unblocked scanners is a farce.

Your Pro-26 does not need any modifications to receive 86 Mhz, which is
TV channel 6 here in the US. When in either of the search modes, change the
step size from the default of 6 MHz for this band to 5, 12.5, or 25 khz.

Source record: 123680

No scanner can be modified for any freq. range, they can only be UN-modified. For example in early (pre-1994) radio shack scanners they were built at the factory to recieve cellular & then blocked. THe "mod" was to unblock or restore the original factory specs. In the case of airband that scanner was never "built" with air so it can't be "restored".

Have been using mine for many years, but before you purchase, verify
if the bnc antenna connection is still well soldered to the pcb board.
After many years of hitting the antenna the connection inside the unit
could break as mine did. However the repair is minor and while you are
at it, you can mod it for cell operation. Did my unit in 25
minutes.Good Luck.

5521. FS: PRO 43 early production, cell capable, with manual and box

Date code 5A2, low serial number, like new with manual and box.
Not fiddled with or modified, can receive cellular with idiot-proof
mod found on KC5KTO's Radio Page.
US$250 including shipping to continental USA, can not negotiate trade
because I am advertising this for someone else, but I wish I could!
